MEMORANDUM

Date: January 28, 2015
To: Council
From: Jessica Coakley and José Montañez, Staff
Subject: Surfclam and Ocean Quahog Cost Recovery Amendment

The following are included for consideration by the Council on the above subjects:

Cost Recovery Amendment

- 1) Staff Recommendation Memo dated January 28, 2015
- 2) Timeline/History of Cost Recovery Amendment
- 3) 3 Letters received from NOAA Fisheries on Cost Recovery Program Requirements
- 4) Overview of all Public Comments (including written comments and hearings)
- 5) Summary of Public Hearing Comments
- 6) Written Comments Received
- 7) Draft Cost Recovery Amendment

MEMORANDUM

Date: January 28, 2015
To: Chris Moore, Executive Director
From: Jessica Coakley and José Montañez, Staff
Subject: Atlantic Surfclam and Ocean Quahog Cost Recovery Amendment – Staff Recommendations

Cost Recovery

The Magnuson-Stevens Fishery Conservation and Management Act (MSA)¹ requires the National Oceanic and Atmospheric Administration (NOAA) Fisheries to collect fees to recover the “actual costs directly related to the management, data collection, and enforcement” of a Limited Access Privilege Program (16 U.S.C. 1854(d)(2)(A)). Therefore, the alternatives contained within this Amendment to the Atlantic Surfclam and Ocean Quahog Fishery Management Plan (FMP) propose 4 different approaches to implement a cost recovery system in the Atlantic surfclam and ocean quahog individual transferrable quota (ITQ) fisheries. NOAA Fisheries has interpreted the “costs to be recovered” to mean those costs that would not have been incurred to the federal government but for the ITQ program (i.e., the incremental costs). Their interpretation is clearly documented in letters contained behind this briefing tab dated February 3 and September 30, 2009. This same approach has been implemented in numerous individual fishing quota (IFQ) fisheries, including the Council’s golden tilefish fishery.

Based on a review of the proposed cost recovery action alternatives, staff recommend Alternative 5 (Shareholder Pays; Tilefish Model). Under Alternative 5, only those shareholders (permanent ITQ allocation holders) whose quota are used to land surfclams and ocean quahogs would pay the cost recovery fee. Those shareholders with quota that do not land any surfclams or ocean quahogs would not pay. This approach is the same cost recovery process used in the tilefish IFQ fishery and ensures that only those shareholders that are active participants in this fishery bear the costs.

Administrative Mechanism to Update Biological Reference Points

Based on a review of the proposed alternatives, staff recommend Alternative 2 (Redefine the Status Determination Criteria). This alternative is administrative and would essentially streamline the process of

¹Magnuson-Stevens Fishery Conservation and Management Act (MSA), portions retained plus revisions made by the Magnuson-Stevens Fishery Conservation and Management Reauthorization Act of 2006 (MSRA), and available at: http://www.nmfs.noaa.gov/sfa/magact/MSA_Amended_2007%20.pdf

updating the stock status determination criteria (i.e., biological reference points) in the FMP. If Alternative 2 is selected, stock status determination criteria would be automatically updated without the need to go through a lengthy amendment process as long as the measures were consistent with National Standards 1 and 2 and met specific peer-review criteria (such as the SAW/SARC process). This adaptive process ensures the Council uses the most up to date information. The last time this FMP was formally updated with stock status determination criteria was in 1998 for ocean quahogs and 2003 for surfclams. Since then, there have been several SAW/SARCs during which new biological reference points were developed, peer-reviewed, and accepted. The Council has already applied them during the specification process for a number of years. They appear in Scientific and Statistical Committee (SSC) and Staff Memos, and other Council documents, but were never formally updated in the FMP through an amendment process and are outdated. Simply put, this is a “book-keeping” exercise intended to keep the Council’s most important books, the FMPs, up to date with the best and current information.

Optimum Yield Range (OY)

After reviewing the proposed alternatives, staff recommend Alternative 2 (Remove OY Range from FMP; Advisors Develop Recommendations for OY during Specifications). Under this alternative, the OY ranges would be removed from the FMP and commercial quotas for surfclams and ocean quahogs would continue to be set under the existing system of catch limits. Under Alternative 2, as part of the specifications process, the Advisory Panel will develop OY recommendations which will be provided to the Council. This alternative would bring this plan into consistency with the other FMPs the Council manages, i.e., surfclams and ocean quahogs are the only stocks with OY ranges specified in the FMP. This would eliminate any of the inconsistencies with the current system of catch limits, and prevent the need for a framework process to modify the upper-end of the OY ranges. It would also prevent inconsistency with the definition of OY on the lower end of the ranges - under the current system acceptable biological catch (ABC) can be set less than the OY range in the FMP. NOAA Fisheries guidance suggests that to achieve OY, both scientific and management uncertainty should be addressed, and OY should not be higher than ABC.

**Timeline on Fee Collection to Recover the Actual Costs
Directly Related to the Management, Data Collection, and Enforcement for the
Atlantic Surfclam and Ocean Quahog Individual Transferrable Quota (ITQ) Fisheries**

1990

- The Atlantic surfclam and ocean quahog (SCOQ) fisheries have been managed under an ITQ system since 1990.

1996

- The Magnuson-Stevens Fishery Conservation and Management Act (MSA) requires the National Oceanic and Atmospheric Administration (NOAA) Fisheries to collect fees to recover the “actual costs directly related to the management, data collection, and enforcement” of any Individual Fishing Quota (IFQ; 16 U.S.C. 1854(d)(2)(A)).

2005

- Discussion on this issue occurs in the March 2005 Government Accountability Office (GAO) report "Individual Fishing Quotas: Management Costs Varied and Were Not Recovered As Required (GAO-05-241/March 2005).

2006

- February 27, 2006 - Letter from the Regional Administrator to establish an ITQ Cost Recovery Committee to develop a program to recover costs in the SCOQ fisheries was received by the Council.

2007

- The reauthorized MSA requires the NOAA Fisheries to collect fees to recover the “actual costs directly related to the management, data collection, and enforcement” of any Limited Access Privilege Program (LAPP; 16 U.S.C. 1854(d)(2)(A)).

2008-2009

- Fishery Management Action Team (FMAT) reformed to address SCOQ cost recovery, excessive shares, and updated EFH issues for the Amendment (then numbered 14).
- Amendment 14 development initiated and scoping document developed.
- February 3, 2009 - Letter from Pat Kurkul to Rich Robins regarding comments on the development of Amendment 14:
 - Council staff had indicated that they believe that the management costs of managing a pre-LAPP fishery in place prior to 1990 should be compared with the current management cost of the LAPP fishery in determining what is recoverable under the MSA.
 - The Agency’s documented its interpretation of what constitutes the collection of fees to recover the “actual cost related to the management, data collection, and enforcement of any LAPP.” The Agency stated that any compensation between the pre-LAPP and current LAPP fishery would not yield a recoverable cost. The agency interpretation of the law (section 303A(e) together with 304(d)(2)(A) of the MSA) is such that the recoverable cost in existing LAPP fisheries are calculated by

isolating the LAPP-specific aspects of the current fishery. Therefore, recoverable costs would be those that would not otherwise exist, but for the LAPP and would be incremental to the management costs of a traditional non-LAPP version of the fishery.”

- September 30, 2009 - Letter from Pat Kurkul to Rick Robins reiterated that the staff interpretation was not correct and that “incremental costs” are not described as “net incremental costs,” or defined by the difference between the pre- and post-LAPP fishery as stated by Council staff. Rather, they are calculated by isolating the IFQ-associated costs from each division, and can only be positive.

2011

- Standardized Bycatch Reporting Methodology took Amendment number 14 (2007), Annual Catch Limit and Accountability Measure Amendment (2011) took Amendment number 16.

2012

- The February 2012 SCOQ Committee meeting discussed next steps for then-numbered Amendment 15.
- At that meeting, General Counsel Joel MacDonald advised that an information collection program could be implemented by NMFS without a Council FMP Amendment under authority granted in section 402(a) of the MSA.
- The Committee voted to split Amendment 15 into several parts: 1) move forward with cost recovery, essential fish habitat (EFH), and the ocean quahog biological reference point update in Amendment 15, 2) request that NMFS develop an information collection program, and 3) move development of an excessive shares cap to the next Amendment.

2013

- August - Council voted to repopulate the FMAT and re-invigorate development of this cost recovery action (and also address EFH, BRPs, and OY issues).

2014

- April, March, and May - FMAT met to discuss the development of the Amendment.
- Amendment referred to as “Cost Recovery Amendment” - not numbered, but titled under new process to improve and simplify communication of Council actions with public.
- October - Council approved the Cost Recovery Amendment Public Hearing Document.

2015

- January - Comment period and public hearings completed.

FEB 27 2006

Daniel Furlong, Executive Director
Mid-Atlantic Fishery Management Council
Room 2115 Federal Building
300 S. New Street
Dover, DE 19904

Dear Dan:

This letter is to advise you that the National Marine Fisheries Service (NOAA Fisheries Service), in response to a Government Accountability Office (GAO) report entitled "Individual Fishing Quotas: Management Costs Varied and Were Not Recovered As Required" (GAO-05-241/March 2005), has committed to work with the Mid-Atlantic Fishery Management Council on adding individual transferable quota (ITQ) program cost recovery to the Atlantic Surfclam and Ocean Quahog Fishery Management Plan (FMP) as currently required in section 304(d)(2) of the Magnuson-Stevens Fishery Conservation and Management Act.

In order to fulfill this commitment, I would like to establish an ITQ Cost Recovery Committee to develop a program to recover costs in the surfclam and ocean quahog fisheries comprised, in part, by representative stakeholders. To facilitate the development of this Committee, I would like to request that you please appoint well-qualified individuals to serve on this Committee. This Committee may also serve to develop a cost recovery program for the golden tilefish fishery, should the Council adopt an individual fishing quota amendment to that FMP. My staff lead for the development of the cost recovery program will be Brian Hooker who may be reached at 978-281-9220.

Sincerely,

Patricia A. Kurkul
Regional Administrator

FEB 3 2009

Richard Robins, Jr., Chairman
Mid-Atlantic Fishery Management Council
Federal Building
300 South New Street
Dover, DE 19904-6790

Dear Rick:

As you are aware, the Council is currently developing Amendment 14 to the Atlantic Surfclam/Ocean Quahog (SC/OQ) Fishery Management Plan (FMP). Amendment 14 is primarily intended to define what constitutes an excessive share in the fishery, and to fully implement limited access privilege program (LAPP) requirements, specifically for individual transferable quotas, as stipulated in the Magnuson-Stevens Fishery Conservation and Management Act (MSA). Under section 304(d)(2)(A) of the MSA, the Secretary is directed to collect a fee to recover the actual costs directly related to the management, data collection, and enforcement of any LAPP.

The SC/OQ FMP has been operating under an ITQ system since 1990, without a cost-recovery program. In development of a cost-recovery program under Amendment 14, Council staff has indicated they believe that the management costs of managing the pre-LAPP fishery in place prior to 1990 should be compared with the current management costs of the LAPP fishery in determining what is recoverable under the MSA. This approach would define the incremental costs as the difference between the pre-LAPP management costs and the current LAPP management costs. It is widely known that the SC/OQ fishery was very costly to manage prior to the ITQ system implemented in 1990; thus, any comparison between the pre-LAPP and current LAPP fishery would not yield a recoverable cost. Council staff cites the following two factors as rationale for using the above approach to calculate what is recoverable under section 304(d)(2)(A) of the MSA: 1) The 2005 Government Accountability Office report to Congress that stated that management costs decreased after implementation of the SC/OQ ITQ program; and 2) that industry contributes substantial funding for the management of the SC/OQ resource by providing for additional science that is used in the SC/OQ stock assessment process. Despite this rationale put forward by Council staff, NMFS does not interpret section 304(d)(2)(A) of the MSA to allow for the consideration of these factors.

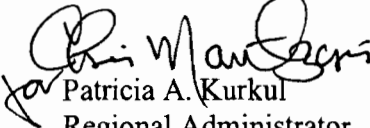

NMFS has interpreted section 303A(e), together with section 304(d)(2)(A) of the MSA, to require that for the collection of fees in LAPP fisheries, the individuals who are granted a temporary property interest in a particular public trust resource provide at least some compensation for the management of that resource. The agency has interpreted sections 304(d)(2)(A) and 303A(e) of the MSA such that recoverable costs in existing LAPP fisheries are calculated by isolating the LAPP-specific aspects of the current fishery. Therefore, recoverable costs would be those that would not otherwise exist, but for the LAPP, and would be incremental to the management costs of a traditional non-

LAPP version of the fishery (i.e., a fishery managed by the monitoring of a quota with in-season closures). In this way, SC/OQ limited access privilege shareholders would be funding a portion of the management, data collection, and enforcement costs of the LAPP for which they hold a temporary interest to the public trust resource. Given this, the Council should include a collection-of-fees option in Amendment 14 that is consistent with NMFS's interpretation of the cost-recovery provisions of the MSA.

My staff will assist Council staff in the assembly of the cost data necessary to develop this alternative within the document. I look forward to working with the Council to complete this important amendment.

Sincerely,

Patricia A. Kurkul
Regional Administrator

Richard Robins, Jr., Chairman
Mid-Atlantic Fishery Management Council
Federal Building
300 South New Street
Dover, DE 19904-6790

SEP 30 2009

Dear Rick:

Thank you for your September 11, 2009, letter regarding Amendment 15 to the Atlantic Surfclam/Ocean Quahog (SC/OQ) Fishery Management Plan (FMP). Amendment 15 is primarily intended to define what constitutes an excessive share in the fishery, and to fully comply with the requirements of the Magnuson-Stevens Fishery Conservation and Management Act (MSA) for limited access privilege programs (LAPP) such as the SC/OQ individual transferable quota (ITQ) program.

As you know, the SC/OQ FMP has been operating under an ITQ system without a cost-recovery program since 1990. It is important to note that section 304(d)(2)(A) of the MSA directs the Secretary of Commerce to collect a fee to recover the “actual costs directly related to the management, data collection, and enforcement,” of any LAPP [emphasis added]. In practice, NOAA’s National Marine Fisheries Service (NMFS) has determined that this requires the collection of a fee to recover costs that are specific to, or associated with, the LAPP. As stated in your letter, the Council proposes that the costs to be recovered are the net incremental costs, defined by comparing the costs of the pre-LAPP fishery with the current costs of the LAPP fishery. However, there is a significant difference between “net incremental” costs and “actual” costs. It is widely known that the SC/OQ fishery was more costly to manage and enforce prior to the ITQ system; thus, any comparison between the pre-LAPP and current LAPP fishery would not be informative as to the actual costs to the Government for this program, nor would this calculation yield a recoverable cost. We do not think there is any reasonable interpretation of section 304(d)(2)(A) that would allow for a subtractive calculation (pre minus post-LAPP costs) by which no costs are recovered in a LAPP. Allowing this type of subtractive approach would allow a fishery that was more costly to manage or enforce prior to a LAPP (i.e., the SC/OQ fishery) to essentially absolve itself of any cost-recovery payment for the duration of the FMP, which would be inconsistent with the plain language of the MSA.

In February 2009, I sent a letter to the Council regarding the NMFS policy on what costs are recoverable in the SC/OQ fishery. To restate: NMFS policy is that the costs to be recovered are the LAPP-specific costs related to the management, data collection, and enforcement of the SC/OQ IFQ program. These costs are positive, and are likely to be a minor percentage of the ex-vessel value of the fishery.

My February 2009, letter used an example of how LAPP-specific costs may be calculated for the fishery, which stated that “recoverable costs would be those that would not otherwise exist, but for the LAPP, and would be incremental to the management costs of a traditional non-LAPP version of the fishery (i.e., a fishery managed by the monitoring of a quota with inseason closures).” Your letter contends that the traditional non-LAPP version of the fishery is the pre-LAPP fishery. However, this term was intended to describe a hypothetical current non-LAPP version of the SC/OQ fishery, i.e., a fishery managed by quota monitoring. A comparison between a hypothetical current non-LAPP version of a SC/OQ fishery and the current LAPP SC/OQ fishery yields costs that necessarily exist due to the ITQ program, i.e., the management costs incurred as a result of processing ITQ allocation transfers, or the database system support to track ITQ allocations.

The first paragraph of your letter states: “Prior NMFS documents indicate that NMFS’ position on cost-recovery is that net incremental costs of the LAP program are subject to cost-recovery, not the cumulative costs or the total costs.” I believe that the distinction between pre- and post-LAPP costs and recoverable costs are clearly articulated in NMFS’s response to the 2005 Government Accountability Office (GAO) report (page 35 of GAO-05-241, Individual Fishing Quotas), as shown below:

In summary, NOAA stresses the distinction between (1) changes in pre- and post-IFQ costs and (2) recoverable costs, and points to the surf clam and ocean quahog program as an excellent example. As GAO reports, management costs in this fishery have decreased after 1990, and NOAA believes this reduction in costs should be an important consideration when fishery management councils are debating the adoption of an IFQ program. At the same time, the attributable costs of the surf clam and ocean quahog program, that under law must be recovered, are positive.

NOAA’s response to the GAO report also states that recoverable costs are those that are directly attributable to the IFQ program (first paragraph, page 35) and, to clarify, my February 2009, letter did not state that NMFS is seeking to recover cumulative or total costs, as stated in your September 2009, letter.

The NOAA technical memorandum, “The Design and Use of Limited Access Privilege Programs (NMFS-F/SPO-86, page 91),” states that the relevant costs to recover are the incremental costs, i.e., those costs that would not have been incurred but for the IFQ program. The technical memorandum cites a NMFS 2003 report from the Alaska Region, “Report to the Fleet, Restricted Access Division, Alaska Region,” as the basis for this policy. This Alaska Region report states that:

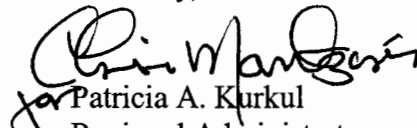

“COSTS OF MANAGEMENT AND ENFORCEMENT: The other part of determining the fee is calculating costs associated with managing and enforcing the IFQ Program. Note these costs are incremental (that is, costs that would not have been incurred but for the IFQ Program). To arrive at these costs, in early September 2005 NMFS agency units and the International Pacific Halibut Commission (IPHC) each calculated their own IFQ-associated costs. NMFS Alaska Region

agency units submitting costs included NMFS/RAM, NMFS Sustainable Fisheries, and NMFS Office of Law Enforcement. Table 4.2 shows the costs by agency and operating unit.”

The report does state that the costs to be recovered are the “incremental costs.” However, they are calculated by determining current IFQ-associated costs (LAPP-specific costs). These “incremental costs” are not described as “net incremental costs,” or defined as the difference between the pre- and post-LAPP fishery, as stated in your letter. Rather, they are calculated by isolating the IFQ-associated costs from each division, and can only be positive. This is entirely consistent with the policy as described in my February 2009, letter, i.e., to recover the LAPP-specific costs in the SC/OQ FMP. Similar methods to discern costs that are directly related to the LAPP, or are LAPP-specific, are in use to calculate the recoverable costs in other limited access privilege programs.

My staff will assist Council staff in the development of this alternative within the document. I look forward to working with the Council to complete this important amendment.

Sincerely,

Patricia A. Kurkul
Regional Administrator

Atlantic Surfclam and Ocean Quahog
Cost Recovery Amendment
Comment Overview

The following provides a summary of common themes provided in both the written and public hearing comments. Please see the summary of public hearing comments and the complete written comments for additional detail.

Comment Period: December 15, 2014 – January 16, 2015

Number of Written Comments Received: 7 during comment period + 1 prior to period

Number of Public Hearings: 4 total (RI, NJ, MD, and a webinar)

Attendance at Hearings: 17 in attendance cumulatively at the 4 hearings; comprised of 13 individuals/people (i.e., some people attended more than 1 hearing).

Frequent Comment Themes

General

- The Atlantic surfclam and ocean quahog fisheries are considered the best managed fisheries in the world.
- These fisheries are unique from other fisheries the Council manages.
- There is no need to for additional regulation in this fishery; fishery is already well managed.
- Stability is very important in this fishery in terms of the processors and markets. It is important for things not to change frequently or quickly.
- This Amendment, and other actions, are not needed.

Cost Recovery

- There were cost savings when the individual transferrable quota (ITQ) system was initially implemented.
- For cost recovery, the costs evaluation should include a pre- and post-ITQ evaluation of costs.
- Recommend no action on cost recovery alternatives.

- If action on cost recovery is taken, then Alternative 4 (equal fee per share) would be next best to no action because it would be most efficient.

Mechanism to Update Biological Reference Points

- No need to change current mechanism; the fishery wants stability.
- No need to speedily update biological reference points.
- Dangerous decision-making could result.
- Surfclams and quahogs are long-lived; therefore rapid updates are not needed.
- National Standards 1 and 2 have greater significance than this administrative action.
- Recommendation for no action on the biological reference points mechanism.

Optimum Yield (OY) Range

- Industry preference that the OY ranges stay in place.
- SCOQ fishery is unique and does not consider the fact that other Council-managed fisheries do not use these ranges as a reason not to retain.
- Stability is important in the fishery, and these ranges contribute to stability and predictability.
- Lower-end of the OY range can be set as low as zero if acceptable biological catch is set below range; industry does not want upper end of OY range to change.
- Recommendation for no action on the OY ranges.

Atlantic Surfclam and Ocean Quahog Cost Recovery Amendment
Summary of 4 Public Hearings Comments

Monday, January 12, 2015: Warwick, Rhode Island

Hearing Officer: Rick Robins

MAFMC Staff: Jessica Coakley

Attendance (3): Alexa Kretsch (University of Massachusetts, SMAST), Doug Potts (NOAA Fisheries, GARFO), Tom Slaughter (Atlantic Capes Fisheries)

Tom Slaughter, Atlantic Cape Fisheries

- Noted that the Atlantic surfclam and ocean quahog fisheries are considered the best managed fisheries in the world, even noted by National Marine Fisheries Service (NMFS) experts.
- There is no need to for additional regulation in this fishery; fishery is already well managed.
- There were cost savings when the individual transferrable quota (ITQ) was initially implemented; therefore, the program resulted in decreased costs for managing the fishery.
- Stability is very important in this fishery, in terms of processors and markets; there is no need for things to be changed rapidly.
- This amendment, and other actions, are not needed.
- Would recommend no action for all of the alternatives.

Tuesday, January 13, 2015: Internet Webinar

Hearing Officer: Stew Michels

Other Council Members: Lee Anderson, Howard King

MAFMC Staff: Jessica Coakley, José Montañez

Attendance (7): Tom Dameron, Peter Himchak (LaMonica Fine Foods), Tom Hoff (Wallace and Associates), Sunny Jardine (MAFMC SSC), David Kielmeier, Doug Potts (NOAA Fisheries, GARFO), Dave Wallace (Wallace and Associates)

Dave Wallace, Wallace and Associates

- Firm represents the clam industry.
- The law says an evaluation is needed before and after limited access privilege programs (LAPPS) go into effect.
- Implementation of the ITQ system was a huge savings to NMFS staff, Coast Guard enforcement, and NMFS enforcement.
- The savings to NMFS is a huge negative number.
- The only thing the new ITQ system requires is to notify tag manufacturers on how many tags to send to quota holders.
- The fishery has always reported all its data, and all data has been calculated and analyzed.
- What was being done then is being done now, just in more computerized way. Dealers used to report by paper, and the data was entered, and audited. Today it is voluntary electronic reporting.
- Unfortunate to be penalized for working to make the system more seamless and efficient for NMFS.

Tom Dameron, Surfside Seafood Products

- Surfside agrees with the comments given by Wallace and Associates.
- If the cost recovery is supposed to be the increase in the incremental costs and those costs were in fact negative, then Surfside would support Alternative 1 (no action) for cost recovery.

Tom Hoff, Wallace and Associates

- Former Council staff, part-time with Wallace and Associates.
- Firm represents 95% of the surfclam and ocean quahog industry.
- Clam industry is unlike any of the other fisheries manages – predictability and stability are the most important traits.
- Rapid change is neither needed nor beneficial.
- NMFS needs to be totally transparent as to what would be included in the cost recovery fees - analyses estimate \$100,000, but could be as high as \$1.5 million under 3%.
- Transparency in costs would go far in terms of garnering industry support for this action.
- Annual increases should be capped – the tilefish cost recovery increased 3-fold in one year.
- Industry is concerned that new costs such as data collection would be added to the costs recovered.
- Additional costs should be run through an advisory panel and be made frameworkable.
- While cost recovery is required for the amendment, the biological reference point (BRP) update and optimum yield (OY) range are subjective for the Council to deliberate on.
- New BRPs from the SAW/SARC have always been presented to the Council, and have always been used in quota setting.
- Use of best scientific information has and always will trump what is in the FMP.
- Industry wants stability in the landings – industry does not want the quotas bouncing around because some model at the SARC artificially changed. Surfclams live for 30 years and ocean quahogs live for hundreds of years - plenty of time to prevent overfishing.
- Support the no action Alternative 5.2.1.
- In terms of optimum yield range, the Council's ACL/AM Amendment did away with the lower end of the OY range and Council can set quotas as low as zero.
- The upper end of the range could be double or triple of current quota, but industry does not want all the uncertainty associated with large scale quota changes.
- Aside from consistency, what is the problem with the OY range?
- Support the no action Alternative 5.3.1.
- Understandable that the Council considers it more effective to address essential fish habitat (EFH) for all its species at once, and removed it from this amendment.
- Delays are almost certain to happen (e.g., NEFMC Omnibus Amendment)
- At the October 2009 Council Meeting, the Council approved EFH designations; it would not be difficult to update the designation with 1 more year of survey data.
- EFH regulations require a 5-year update – this is one of the required actions.
- Staff should be spending time on required rather than subjective actions.

Wednesday, January 14, 2015: Cape May, New Jersey

Hearing Officer: Tom Baum

MAFMC Staff: Jessica Coakley

Attendance (6): Erling Berg, Peter Himchak (LaMonica Fine Foods), Daniel P. LaVecchia (LaMonica Fine Foods), Michael A. LaVecchia (LaMonica Fine Foods), Steve Veltman (Bumble Bee Foods), Dave Wallace (Wallace and Associates)

Peter Himchak, LaMonica Fine Foods and Associates

- Providing preliminary comments here, but will submit written comments.
- Administrative Amendments can be more challenging to understand. Given all the different facets of the fishery, I wonder how many of the Council members really understand the details of the fishery, tags, how this works with the dealers.
- On the OY issue, these fisheries are so unique and have so much history. The Council should get strong guidance from the industry.
- In terms of the cost recovery alternatives, the industry does not have a preferred alternative at this point; my recommendation on selection of this [preferred] is from experience with NJ fisheries licenses and permits
- NJ limited licenses or permits had to be renewed each year – they were considered a financial asset, and you had to pay to retain it, whether or not it had landings associated with it.
- Latent permits were more of an administrative headache than those that fished and submitted their reports. The transferability was constantly occurring and required a lot of time and resources. The states had no cost recovery programs to address these costs.
- There are administrative burdens associated with any of these, but recommend the industry should consider Alternative 4 as preferred, where all shareholders pay an equal fee per share.
- If you want to retain this asset, you should pay some of the costs on annual basis.
- For the administrative mechanism to update BRPs, do not see a problem with alternative 2 but find this administrative mechanism difficult to understand. It was noted that it was similar to the states using a notice to change fishing measures in the regulations.
- There are unique aspects to this fishery, and specific social and economic factors that play into the management of this fishery.
- None of the other fisheries have an OY spelled out, but in this case feel it is important to retain.
- Would favor retention of the optimum yield range via Alternative 1 (no action) or Alternative 3, because stability and predictability are very important in this fishery.

Dave Wallace, Wallace and Associates

- Surfclams live a long time, quahogs live even longer; the notion that summer flounder, black sea bass, scup, or squid should be put in the same category is a mistake.
- Invertebrates are different than vertebrates - different dynamics in biology of species.
- There is never a panic that the fishery will collapse overnight. In our lifetime, we won't need to worry about it.
- Transparency and predictability are important.

- Discussed briefly what proportions could be attributable to the surfclam and ocean quahog costs recovered.
- Some members this firm [Wallace and Associates] represents, would support Alternative 4; those members are adamant that all stakeholders who have the privilege should be responsible for paying the costs.
- On BRPs, National Standards 1 and 2 trumps everything.
- Prefer Alternative 1 (no action) on the BRP mechanism.
- Do not like the notion that any peer review chosen can be used; have the SAW/SARC process.
- Industry is highly involved in finding the truth working with the Science Center [NEFSC] through the SAW/SARC process. We have never overfished either stock, nor is overfishing occurring.
- An outside review is done. It then goes to the SSC, which cannot go any higher than the ABC set by the science. Thinks system works extremely well.
- For OY, do not want to see a 10 million bushel surfclam quota. The quota could easily be 3 times what it currently is. That would create absolutely chaos in the industry.
- For OY, prefer Alternative 1 (no action).
- Noted that firm [Wallace and Associates] represents most of the surfclam and ocean quahog industry.

Thursday, January 15, 2015: Berlin, MD

Hearing Officer: Howard King

MAFMC Staff: Jessica Coakley

Attendance (1): Dave Wallace (Wallace and Associates)

Dave Wallace, Wallace and Associates

- Last night's hearing [Cape May] was unique; there were many questions asked.
- Many persons who didn't understand issues well before they got there should understand them better after the meeting.
- There is a significant misunderstanding as to what "incremental" means for cost recovery.
- Prior to the implementation of the ITQ fishery, the clam industry was managed with a fixed quota, a huge number of vessels (160), and the objective of the plan was to keep the fishery open on a year round basis.
- At almost every Council meeting, a report was given on catch status for that quarter of the year; Council would recommend adjusting the hours fished for that quarter.
- Full time staff at the regional office were constantly tracking data and writing rules; huge amount of energy was exerted by NMFS and Coast Guard.
- At one point, could only fish once every two weeks. This set up an incentive to violate the regulations.
- Classic example of not well thought out fisheries management; it did not work as industry became more and more efficient.
- This is why the system had to change, so industry could manage itself under a new set of parameters.
- The objective of Amendment 8 (efficiency) was hugely successfully. Lee Anderson was responsible for advocating for first ITQ system in country.

- Once implemented, the fleet went from 160 vessels to about 80, then in about a year due to attrition down to 50 or 60 vessels, and then down to 40 full-time vessels for both the surfclam and ocean quahog fisheries.
- In the 1996 MSA, Ricks Savage and I were highly involved with the portion of the act to use ITQ as collateral. It is still in the act. The reason that it is not used is because Senator Stevens approved the wording, and would not change the language in response to the lawyers. Only need a 3 word phrase to fix the act.
- IRS would let quota be pledged to the banks, so it could be used for financing. It circumnavigated the loan registry [in the act].
- Upshot is that the clam industry has been managing itself except for quotas since 1990, with no real intervention needed from NMFS, Coast Guard, or the MAFMC.
- Used to spend whole days at every MAFMC meeting on clams; NEFMC used to manage their portion of the resource, so they had meetings too.
- Many of these ITQ systems, or LAPP systems, were under the American Fisheries Act (which was an Amendment to the MSA for fisheries in the Bering Sea). It is a little different, but tied to the MSA. Senator Stevens arranged to lend land-based processors trawlers money to buy out or bankrupt factory trawlers. That became a limited access fishery. Their fees for that went to pay it back. So 3% of the incomes from the factory and shore-based fisheries was to pay back the principle.
- In 1996, Senator Lott was pressured to put a 4 or 6 year moratorium on ITQs.
- Cod/Halibut in the Bering Sea was allowed to move forward. They would catch their quotas in 1 day. Senator Stevens wanted an exception for them, and they agreed to pay the full 3%. This was because NMFS and the Coast Guard estimated it would cost \$18 million/year to supervise that fishery.
- That was the justification for the full 3%, which they [NMFS] still use.
- Before and after the ITQ clam fishery, there is the exact opposite situation.
- All clams go to processing plants; all processing plants are licensed. They [NMFS] know where they are. A clam cage that is empty with a tag, or full of clams without a tag, is a violation. It's the easiest fishery because there is no fresh market and clams are required to be landed in cages.
- The enforcement became almost too easy. Tags are different colors for surfclams and ocean quahogs. It went from about 100 violations a year, to less than 50 violation in 5 years.
- Most violations have been for non-licensed clam boats (state waters vessels) that go out to fish federal waters without a federal permit or ITQs. The fines were strong, and that is no longer a problem.
- Instead of spending millions a year to enforce pre-ITQ, it went to almost zero after the ITQs.
- This management plan is remarkably successful. The most successful in the US in my opinion.
- With Amendment 15, 16, and 17, the federal government has now started to interfere in a legitimate, well-run fishery, to be micromanaged.
- Cost recovery is all about increased incremental costs; the [clam] fishery has decreased costs.
- If it took \$2 million to enforce in 1989, then in 1990 when the ITQs went into effect it cost maybe \$100,000 that year - because some people tried to challenge the system.

- One individual was fined \$700,000. The worst enforcement penalty is suspension or taking of ITQ. It could be a multi-million dollar fine in terms of ITQ value.
- The reason there are so many owners, is because if there was a seizure of a permit you don't want all your quota in one place.
- In theory, the government owes the industry money.
- There is no good reason the clam industry should have to pay fees because the cost of managing is a fraction of what it was pre-ITQ.
- NMFS and MAFMC have Amendment 15, 16, and 17 backwards. Need to define an excessive share first. Had 6 experts that met and couldn't agree.
- All the mathematical formulas for excessive shares are anti-trust law formulas. The fishery plan already has an antitrust definition.
- The clam fishery does not control fishery because it is just one ingredient that can be easily substituted. We have no control over our future whatsoever.
- If someone does not stop this nonsense, we will go through this data collection nonsense.
- You need to first identify excessive shares, and then decide what information to collect.
- Information collection wants to know everything about everyone in the clam business. It's none of their business.
- If that goes through, and cost recovery goes through, then they [NMFS] will say it is brand new and charge money for it.
- Position on cost recovery is Alternative 1 (no action), because it is not needed. If you look at the reason for the law, it doesn't apply to us.
- If the Council goes through with this, then we advocate for Alternative 4, where each shareholder pays an equal fee per share. There is precedence - NJ inshore permits and NY inshore permits (maybe MA permits) require payment whether you fish or not.
- On the BRPs, that action serves no purpose; prefer Alternative 1 (no action).
- National Standards 1 and 2 trumps the whole thing; best available science and can't overfish.
- If you did away with it, the surfclam quota could go to 10 or 12 million bushels.
- Fishery needs consistency throughout. Customers are big multi-national customers that buy product as an ingredient. They need to know they can have growth in the product. Right now, we catch about 70% of surfclams and 60% of quahogs. We can say to General Mills, Campbell Soup, and HJ Heins, if you want to promote your product, we will have enough product to fulfill your demand.
- We don't want to put them in a situation where there is some uncertainty. They may deemphasize that product as an ingredient. They will just go and buy something else. We don't compete with red meat and poultry. In making soups and products, clams are just the garnish. You can use clam juice and make soup without a clam.
- On the OY Range, this goes back to the notion that OY was set in the beginning of the management system. It was looked at by industry and NMFS. They looked at production from 1960-1975 and would bump along at 15, 20, 30 million lbs, then would pop up and overfish and collapse. Last one was over Cape Charles, at over 100 million lbs from that area, and the fishery collapsed.
- We were the first fishery who said we are the problem; we take each other's customers, drive prices down, overfish and collapse.
- We had written a management plan before the MSA went into effect.

- Went to Congress for authorization to be managed. Had many states together, and was first management plan that went into effect.
- MAFMC should be proud that they don't have any overfished fisheries.
- Unlike finfish, it's easy to manage clams compared to black sea bass or fluke. They migrate and have a recreational component. [The clam] fishery doesn't have any of those problems.
- We have a good idea of how many clams are out there. Spend hundreds of thousands of dollars in cooperation with Eric Powell and University of Southern Mississippi. We have an entire science center set up, of which the Northeast science center is a member (Russ Brown is the representative).
- We couldn't try harder to be a good citizen and to manage our fishery so it is sustainable in the foreseeable future.
- The scallop industry brags about having rotational management. We have it; we just don't have it in regulation. We try to take pressure off small clams in the southern areas so they can grow to maximum yield per recruit.
- At every assessment for the last 30 years, the clam industry sends scientists, business people, and lawyers and spend as many weeks on surfclams and ocean quahogs as necessary. Then we go to peer review meetings, and we act as support to the NMFS for peer review.
- We are interested in having the SAW/SARC system with the peer review of outside experts - that makes an enormous amount of sense.
- We have spent as much as 5 weeks a year on 1 species.
- For OY, Alternative 1 (no action) is preferred; the system isn't broken. KISS – keep it simple stupid.
- That's why this works, this is a simple plan. There aren't a lot of rules. New England is a frustrating place. They close groundfish out of the deep blue sky. None of our boats have groundfish permits, so we don't get the documents. I've had to start reading the federal register in detail just so I can tell the class, we can't go in there.
- The NMFS and NEFMC broke the law about 6-8 months ago. I haven't been spending all my time at the NEFMC meetings. On the last day, under new business, Oceana said they should close most of Georges Bank. And so, NMFS closed it. That's where we fish. So all of a sudden they just closed Georges Bank fishing grounds just because Oceana suggested it be done. Ironic portion of that is that NOAA spent \$7.5 million through NOS to do the research so we could get George's Bank open for controlling PSP. And now there is another proposal by the scallops and environmentalist to close it again. Now John Bullard knows that, and so if it closes, he knows we are the only ones who fish there. There are no scallops. They said they'd just close it. We are between a rock and a hard place, or cobble and sand.
- We have had two violations for being in closed areas because Captains didn't know. With VMS the Coast Guard monitor's from their vessel, takes a picture, and call in the violation.
- For the best managed fishery, the best thing we can do is leave it alone.
- Noted that his firm represents the clam processors of the US.

Re: Cost Recovery Amendment Comments

Dear Dr. Moore:

The following comments are submitted by Sea Watch International, Ltd. in connection with the MAFMC's consideration of the pending FMP "cost recovery" amendment. Sea Watch is a processor of surfclam and ocean quahog shellstock whose products are distributed throughout the United States and internationally.

We will comment on each of the three elements of the pending amendment as follows:

Cost Recovery

Given the information that has been provided regarding the "cost recovery" alternatives, the Council for now should adopt Alternative 1 which would result in no current action on cost recovery, because there has been no demonstration that such "cost recovery" is either necessary or legally required.

The law clearly limits recoverable costs under the MSA to those "incremental" costs associated with the management/data collection/enforcement of a limited access fishing program (the ITQ program, in our case).

Since only "incremental" costs may be assessed, it is necessary to compare the cost of administering the current ITQ limited access plan with the cost of management of the surf clam/quahog resource in the absence of an ITQ program. The hearing draft provides no information at all concerning the latter level of expense, and therefore a comparison of "incremental" costs for administering an ITQ plan cannot be evaluated.

The Council staff and the public hearing draft and its antecedents have misconstrued and misapplied the term "incremental" in the assessment of costs. The draft would propose to count as "incremental" costs simply all costs of administering the ITQ program, including its administration

Quality and Satisfaction Guaranteed

January 14, 2015

Page 2

and enforcement, as opposed to other “costs” related to the operation of the fishery such as the periodic at sea surveys and assessments for both clam species. But this is not the correct comparison under the MSA. Again, the MSA requires the collection only of incremental costs that are those costs that exist specifically because of the implementation of an ITQ plan, compared with the cost of management in the absence of an ITQ plan. That is what makes those costs “incremental.” If there were no ITQ plan in place NOAA/NMFS/MAFMC still would have the legal obligation to manage the fishery and enforce their regulations. This most likely would be done in the same manner in place before the ITQ amendment was adopted – that is, by way of trip limits, days at sea, etc. And it is these latter costs that have not been laid out or even estimated in the hearing draft.

We can be relatively certain, however, that the costs of administering/managing/enforcing regulations in the fishery without the ITQ program would be substantially higher than those costs are with ITQs in place. All will remember that, pre-ITQs, millions of dollars were expended on such things as enforcement of the time limits as well as Council meetings that included considerable discussion/decision making on ever changing time/day limits at virtually every Council meeting throughout the year. Indeed, a primary reason for adopting ITQs was to eliminate the extremely burdensome expense of fishery management without ITQs.

So until and unless the Council and NOAA/NMFS provide the cost of surfclam/quahog management without ITQs in place, one cannot compare whether the cost of management with ITQs is greater such that there is an “incremental” cost to the ITQ program. For this reason the Council should adopt Alternative 1 and, at least at this time, maintain the status quo with no fee recovery, because no legal basis, or factual foundation, for the collection of such fees has been offered or demonstrated.

In the event that the Council incorrectly elects not to adopt Alternative 1, then Alternative 4 should be selected. There are two benefits to this alternative: first, it is the most economically efficient of the alternatives, and second it is the most fair for all concerned.

Alternative 4 is most efficient because it would require the least administrative effort to collect the fees. All that would be necessary would be for NOAA to provide the respective share of the expense to each ITQ shareholder, which shareholder then would remit the fee directly to NOAA. No other parties would need to participate in the transaction and NOAA would have the easiest means of tracking who has paid and who has not. This would also result in less overall program expense, minimizing the expense ultimately borne by the industry.

Further, Alternative 4 is the fairest proposal because it ensures that all who benefit from the ITQ program pay for a share of its administrative expense. Those who do not actually use their tags to harvest shellstock in a given year still benefit substantially from having the ITQ program in place. It gives value to the shares that they own, and predictability regarding how those shares may be treated through transfers and otherwise. I have made the suggestion at committee meetings, which I will repeat here, that this is analogous to property taxes for public schools. All property owners

participate in paying the tax, even if they do not have children in the schools, because having an effective school system in place maintains the value of their property along with the property of everyone else.

So Alternative 4 should be selected if the Council does not adopt the most appropriate and best alternative, which again is Alternative 1.

Biological Reference Points

As with the cost recovery proposals, the alternative on Biological Reference Points (BRPs) should be Alternative 1, no action, because there is no necessity for action on BRPs and the proposals before the Council for such action would merely result in unnecessary paperwork and potentially dangerous decision making.

As the hearing draft concedes, BRPs by law must be “updated” when new science becomes available because, under National Standard 2, the Council is required to base all management decisions on the “best scientific information available.” Therefore, there is no need to create a new mechanism for adjusting BRPs since, whenever new science requires that a BRP be adjusted, the Council automatically must make that adjustment under National Standard 2.

Moreover, to the extent that BRPs are considered in the context of assessments or otherwise, the current procedure for amending the applicable BRPs – through the formal FMP amendment process (like what we are doing right now) – is most appropriate, especially for long lived (surfclams) and extremely long lived (quahogs) species. Because the status of these stocks changes ever so slowly over a period of many years, there is no need for “immediate action on BRPs.” Rather, BRPs should be amended through careful and contemplative action, including the availability of substantial public/industry input into the process, through the existing FMP amendment procedures.

The alternatives for “peer review” of BRPs, together with the ability to change BRPs outside the amendment process, would lead to unnecessary bureaucracy and questionable scientific decision making, as may be seen from the draft itself. Regarding the bureaucracy, take a look at the description of proposed procedure at pages 14 through 16 of the draft. This would be a cumbersome exercise and would not include the procedural and public input safeguards that are now utilized whenever a BRP is proposed to be changed.

The questionable decision making could result from the types of “peer review” that would be permitted under the alternatives – these would not be “rigorous” despite claims in the draft to the contrary. The best example of this is the procedure followed by the MAFMC’s SSC when it “peer reviewed” and chose to “throw out” the overfishing BRP in 2013. The draft specifically states that the sort of “review” that could justify a change in BRPs would include “MAFMC SSC Review.” This sort of “review” occurred in 2013 with a discussion lasting about an hour plus, among a group

which included many who knew little or nothing at all about the surfclam/quahog resource, and many of whom offered uninformed comments based on simply personal opinions (e.g., “the ocean quahog resource is headed toward extinction”). This SSC “review” did not come close to the “rigor” of an actual peer review through an independent body, that occurs over the course of at least several days when a benchmark stock assessment occurs. The Council should ensure that it is this stock assessment type “peer review” that occurs whenever it is proposed to amend a BRP. And, again, to ensure that adequate public input and Council deliberation is part of any BRP amendments, the Council should adopt Alternative 1 on the BRP element of the pending amendment.

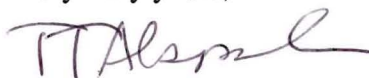

Optimum Yield Range

Once again, the Council should adopt Alternative 1 (no action) as the preferred alternative on potential changes to how OY is specified. As a practical matter, the Council already is operating under regulations that allow the OY to be driven all the way down to zero – regardless of the “official” OY in the FMP – because if the SSC sets the OY below the minimum point in the plan, the Council must follow suit and set a quota below that OY range so as not to exceed ABC.

On the other hand, the maximum level of OY should stay where it is and not be flexible enough to change quickly and without a formal FMP amendment. Having a maximum OY lends stability to the fishery – both for quota holders and processors – and ensures that an unnecessarily high OY will not be adopted solely for biological reasons (as could occur now given the excellent health of the surfclam stock). It is the preference of industry to have the 3.4 million bu and 6.0 million bu OY limits remain in place, as both limits will continue to provide the industry ample latitude to expand for the foreseeable future (given that we are harvesting only around half of the quotas), but will also offer a finite planning horizon in terms of increased production. In the event that markets explode and demand for the resource increases, there will be ample time to propose and adopt an amendment to the upper OY limit through the formal FMP amendment process already in place.

We thank you for considering these comments.

Very truly yours,

Thomas T. Alspach, General Counsel

"In recent years, efforts to manage fish stocks appear to be less successful than anticipated. In consideration of the level of success, please consider my recommendations. Our economy cannot sustain more regulatory fees. I believe that the MAFMC can find a way to streamline their operation and avoid more fees. If this is difficult to achieve, because of regulations, then you should petition to change the regulations. We can review these fees in the future if the MAFMC can demonstrate more reliable estimates and predictions of the fish stocks managed."

Chris Moore, Executive Director
Mid-Atlantic Fishery Management Council
800 North State Street, Suite 201
Dover, DE 19901

Dear Chris,

Following are my comments on the “SCOQ Cost Recovery Amendment”

Cost Recovery

Incremental costs are the costs that differentiate your operational costs between and among various alternatives. In other words, what are the additional costs associated with managing the SCOQ fishery under its present management scheme versus the costs associated with some other management scheme? As there is no substantive change in SCOQ management contemplated under this amendment, then the best approach to determine incremental costs would be to compare current costs of SCOQ management with the costs of SCOQ management prior to the current ITQ system.

What could be easier to illustrate incremental costs – simply use a before and after cost comparison to determine what the incremental costs are for the current management system. As we both know, this would result in cost rebates to the SCOQ participants inasmuch as the ITQ system eliminated the onerous time and human capital costs associated with NMFS enforcement of time / day limit management measures, NMFS data collection activities to capture landings by area and season, and the Council’s management process that led to the Council and its Staff having endless discussions regarding appropriate management measures for the fishery at nearly every Council meeting. Much like Sisyphus and Tantalus, the Council was constantly fixated on “hitting a moving target from a rolling, pitching, moving platform”.

What a waste of time and effort that was! Or, said another way, what a savings has come to pass to both NMFS and the Council since the implementation and use of an ITQ system for SCOQ management. Bottom line, do nothing – **Alternative 1.**

Biological Reference Points

Not unlike the absence of genuine need for establishing incremental costs under this proposed Amendment, so too is there an absence of need [other than an arbitrary update requirement driven by the MSFCMA] to re-address BRPs. What are the “drivers” to do so? Clearly, all

FMPs are governed by NS 2, i.e., best science. As this is the law, it has a greater significance and effect on FMP operation than some lesser policy call as used by BRPs. What is the real need to change the mechanism / process governing BRPs? NS 2 requires the Council and SSC to use “best science” in making its management decisions. It seems that this proposal is more an exercise in circular reasoning than in real change to the process that the Council and its SSC must honor under MSFCMA. Again, do nothing – **Alternative 1**.

Optimum Yield Range

Same position as the other two issues . . . do nothing – **Alternative 1**. The Council has a duty to not exceed ABC. Moreover, the Council cannot exceed its SSC’s upper limit recommendation of OY regardless of where it is established, but the Council can reduce such a recommendation to zero if it determines on socio-economic factors that such an action is appropriate. Given this construct, why is a change necessary? I for one do not believe it is necessary.

Sincerely yours,

Daniel T. Furlong

Re: Cost Recovery Amendment Comments

Dear Dr. Moore,

Surfside Foods, LLC is a vertically integrated seafood processor located in Port Norris, NJ. We operate a fleet of seven commercial clam vessels harvesting surfclams and ocean quahogs from federal waters and at times buy from outside and independent catchers. Our vessels operate out of Point Pleasant and Atlantic City, New Jersey as well as Ocean City, Maryland. I am responding to the Federal Register Notice, request for comments, addressing cost recovery, updating stock status determination criteria and optimum yield ranges in the Atlantic Surfclam and Ocean Quahog Fishery Management Plan. I wish to comment on each portion of the rules being considered for proposal.

Measures for collecting fees and recovering costs associated with the management of Atlantic surfclam and ocean quahog individual transferable quota fisheries:

I am in favor of Alternative 1, no action. The information provided states that NOAA Fisheries seeks to recover those costs that would not have been incurred but for the ITQ program. It is accepted as fact that in switching to an ITQ program additional costs were not incurred, but the ITQ program resulted in *significant cost savings* because the fisheries required substantially less enforcement effort and less management effort. For this reason there are not incremental costs to recover.

If the Council elects not to adopt Alternative 1 then I would be in favor of Alternative 4 as the next best option. Each shareholder should pay a fee proportionate to the shares owned, directly to NMFS. This option would require very little administration, the fewest number of parties, the fewest transactions and the lowest overall program expense. By having all shareholders pay, each

QUALITY SEAFOOD PRODUCTS

participant and beneficiary of our ITQ program would pay for a share of the administrative expense.

Measures that facilitate incorporation of revised stock status determination criteria (biological reference points) for surfclam and ocean quahog into the Fishery Management Plan:

I am in favor of Alternative 1. The draft amendment does not give any rational as to why an administrative mechanism is needed to update biological reference point alternatives. The procedure currently in place for amending biological reference points through a formal amendment process is the most appropriate for these long lived species. These are not species that require frequent management action. The fact that our quotas are set for three year periods is an example of the slow measured steps that give our fishery the predictability and stability that I and others in the industry desire.

Measures that would modify or eliminate the optimum yield ranges for surfclam and ocean quahog currently in the Fishery Management Plan:

I am in favor of Alternative 1. Again, the draft amendment does not give reasonable rational as to why it is necessary or even beneficial to modify or eliminate the optimum yield ranges for surfclam and ocean quahogs currently in the Fishery Management Plan. This measure is not needed to prevent overfishing. Quotas cannot exceed the SSC's upper limit recommendation of OY regardless of where it is established in the FMP. When the surfclam and ocean quahog FMP established a limited access system for the fishery in order to achieve optimum yield the Council and the Secretary took into account the participation in the fishery, the historical fishing practices in, and dependence on, the fishery and the economics of the fishery in deciding the OY ranges in the plan. Those that participate in, depend upon and deal with the economics of these fisheries on a daily basis do not favor measures that would modify or eliminate the upper end of the optimum yield ranges for the surfclam and ocean quahog fisheries.

Thank you for considering my comments.

Sincerely yours,

Peter A. LaMonica, CEO

January 16, 2015

Dr. Christopher M. Moore, Executive Director
Mid-Atlantic Fishery Management Council
800 North State Street
Suite 201
Dover, DE 19901

Re: Cost Recovery Amendment Comments

Dear Dr. Moore:

Kindly accept these comments from LaMonica Fine Foods on the Mid-Atlantic Fishery Management Council (MAFMC) Amendment to the Atlantic Surf Clam and Ocean Quahog Fishery Management Plan, called the Cost Recovery Amendment. The surf clam and ocean quahog industry has maintained an excellent, cooperative working relationship with the MAFMC to ensure that management of both resources is effective and efficient in the continuance of the Individual Transferable Quota (ITQ) management system established 25 years ago

LaMonica Fine Foods, founded in 1923 as a small seafood shop that specialized in fresh, locally harvested seafood, has a long and storied history in the seafood harvesting and processing industry. Today, LaMonica Fine Foods is a bustling seafood supplier for the retail and restaurant trades, having the largest hand shucking plant with more than 200 employees and operating its own fishing fleet. It is proud to be vertically integrated from boat to customer to retain the quality and control throughout the processing, packaging and delivery of its finished products.

COST RECOVERY

The surf clam and ocean quahog industry (hereafter referred to as the clam industry) questions and disagrees with the MAFMC's interpretation of the "incremental costs" concept which the MAFMC uses as the rationale for developing the proposed cost recovery program. It is the clam industry's contention that under the Magnuson-Stevens Fishery Conservation and Management Act, incremental costs are those costs incurred by the management agency subsequent to the implementation of an ITQ program in comparison to those costs associated with the monitoring and enforcement of a fishery prior to the development and implementation of an ITQ program. Since the Amendment presents no cost estimates for managing these fisheries prior to the implementation of the ITQ program, the clam industry questions the basis for developing a cost recovery program without specifically describing in detail what the incremental costs are that resulted from the ITQ program. The clam industry is also well aware that prior to the development and implementation of the ITQ program for surf

clams and ocean quahogs, the costs associated with enforcement and monitoring of the fisheries' activities and landings were astronomical in comparison to post-ITQ formation costs, especially when considering mandatory VMS on all clamming vessels and cage tag requirement for all landings. How then does the MAFMC come to the determination that the ITQ program has generated incremental costs that justify implementing a cost recovery program? **On the basis of these comments, the clam industry supports Alternative 1 (No action/Status Quo) as the preferred alternative to the Amendment's Issue 1, Cost Recovery Alternatives.** The clam industry sees the proposed cost recovery program as just another fee assessed the fisheries to support the administration of an ITQ program currently running seamlessly.

Should the MAFMC not acknowledge the wisdom and justification of this line of reasoning rendering the coast recovery program as unnecessary, the clam industry would first like to see a detailed description of all costs that will be assessed the clam industry and how dollar amounts are estimated by category. While the clam industry recognizes that cost recovery programs on ITQ programs can reach up to 3% of the ex-vessel landings, the clam industry is quick to point out that with electronic daily reporting of landings by area voluntarily adopted by the clam industry to minimize administrative costs and with management uncertainly acknowledged by the MAFMC as 0% for both the surf clam and ocean quahog fisheries, administrative cost estimates should be minimal, far below the allowable 3%. With the processors also electronically reporting every day, it would appear that the only costs associated with these ITQ programs is the initial distribution of cage tags to shareholders, with the costs of the cage tags being paid by the tag holders themselves

In the event that a cost recovery program is implemented for the SC/OQ ITQ program, the clam industry would then support Alternative 4 (Shareholder pays directly; equal fee per share) as the preferred alternative to the Amendment's Issue 1, Cost Recovery Alternatives. Any share or allocation in a limited entry program is a financial asset to the individual or corporation that qualified for that privilege. Whether that privilege is utilized or not, i.e. whether or not there are any landings associated with that privilege, doesn't diminish the fact that the share or allocation is still a financial asset that may be activated at any time in future years. To that end, all shareholders (permanent ITQ allocation holder) should pay NOAA Fisheries an equal fee per share, regardless of whether the shares were fished or not. Shareholders would pay NOAA directly, as per the requirements of Alternative 4.

BIOLOGICAL REFERENCE POINTS

Under Issue 2, Administrative Mechanism to Update Biological Reference Points, the clam industry supports Alternative 1 (No action/status quo) as the preferred option that requires reference points be updated in the Fishery Management Plan through an Amendment process. With the biological reference points for surf clams and ocean quahogs coming out of the SAW/SARC process, the clam industry sees no reason to change the current mechanism governing biological reference points. The MAFMC's Scientific and Statistical Committee's annual review of best available

scientific information when setting Allowable Biological Catch (ABC) under the guidelines of National Standards 1 and 2 works well in the specifications setting process. The clam industry is reluctant to modify the current practices and questions the need to speedily change the biological reference points. Stability and predictability in annual quotas are business cornerstones for the clam industry's market place. What may be a necessary process for summer flounder, scup, black sea bass, and spiny dogfish doesn't necessarily meet the needs of the SC/OQ ITQ programs.

OPTIMUM YIELD RANGE

The clam industry does not agree with the logic that since all other fisheries do not specify optimum range values, the surf clam and ocean quahog fisheries do not need to retain this range of values. The SC/OQ ITQ program is unique in so many ways that the inclusion of an optimum yield range that was incorporated early in the FMP process has served the fisheries well and is vital in the stability and predictability of the clam industry. **Under Issue 3, Optimum Yield Range, the clam industry supports Alternative 1 (No action/status quo) as the preferred alternative that would require the MAFMC to do a Framework to modify Optimum Yield (OY) Range.** The OY range poses no threat to overfishing since the upper bounds of the OY range cannot exceed the ABC in the specifications setting process.

LaMonica Fine Foods appreciates the opportunity to submit these comments on the MAFMC Cost Recovery Amendment. Additionally, LaMonica Fine Foods looks forward to a continuing excellent working relationship with the MAFMC to ensure that the surf clam and ocean quahog ITQ fisheries remain one of the best fisheries management programs administered by the MAFMC.

Sincerely,

Michael A. LaVecchia
Vice-President Operations
LaMonica Fine Foods

Dr. Christopher M. Moore, Executive Director
Mid-Atlantic Fishery Management Council
800 North State Street, Suite 201
Dover, DE 19901

Re: Cost Recovery Amendment Comments

Dear Dr. Moore:

I am responding on behalf of my clients in the North Atlantic Clam Association, to the Mid-Atlantic Fishery Management Council's (MAFMC) proposed Cost Recovery Amendment. Our clients account for over 95% of the primary processing capacity and also include many of the fishermen involved in the Atlantic surfclam and ocean quahog fisheries.

As you are aware, the surfclam and ocean quahog industry has tremendous angst over this Amendment. We firmly believe it is NOT needed at all. Nothing in this Amendment will benefit the resources or the fisheries. This is bureaucracy for bureaucracy's sake.

I will have comments on each of the three items in this Amendment, but first want to emphasize one point. The clam industry is unlike nearly all the other fisheries that the Council manages. PREDICTABILITY and STABILITY are two very important desirable traits for this fishery. The industry is highly vertically integrated and landings are of a raw product that is not sold directly from the boat to the retail market. Rapid change is neither needed nor beneficial for this industry.

COST RECOVERY

For nearly a decade now, the MAMC has been citing the inconsistency between the NOAA policy (Anderson and Holliday 2007) and the interpretation of the former Regional Administrator as to what costs in a limited access program (LAP) are to be recovered. Anderson (the MAFMC Vice Chairman) and Holliday (former NMFS Chief of Policy) in their NOAA Technical Memorandum are very clear that "incremental costs" are the relevant costs (page 91). The Technical Memo even mentions that if Congress had wanted something else they should have

e-mail: DHWallace@aol.com

addressed it in the December 2006 Magnuson reauthorization. Congress did not change anything relative to this issue. The law clearly limits recoverable costs to those “incremental” costs.

NOAA Catch Shares Policy on incremental costs (section 2.2) states: *“It is NOAA policy to compute and recover only the incremental operating costs associated with LAPs from participants.* Section 303 A(e) of the MSA requires cost recovery of the management, data collection and enforcement costs of a LAP. The relevant costs to recover are the incremental costs, i.e., those costs that would not have been incurred but for the LAP program. Conceptually, measuring these costs involves a “with and without” comparison of the cost of running the management program for the specified fishery under the status quo regime, relative to the cost of running the management program under the LAP program. The difference is the incremental costs attributable to implementing the LAP program. This approach limits the participant’s costs of adding LAP programs, and minimizes any disincentive to consider catch shares for Councils and their constituents as they evaluate replacing non-LAP programs with LAPs.”

A 2005 General Accounting Office (GAO) report stated that NMFS should develop guidance and should implement cost recovery for all ITQ programs. This GAO report stated that the management costs DECREASED after implementation of the ITQ program for the surfclam and ocean quahog fisheries. The foresight of the MAMC members, industry, and NMFS generated this tremendous decrease in costs of management. Objective 2 of Amendment 8 (ITQ Amendment implemented in 1990 and still in place today) states: “Simplify to the maximum extent the regulatory requirement of surfclam and ocean quahog management to minimize the government and private cost of administering and complying with regulatory, reporting, enforcement, and research requirements of surfclam and ocean quahog management.”

As you know, the surfclam and ocean quahog fisheries were the first ones in this country managed under the Magnuson Act with the development of an FMP in 1977. Initially, the industry needed federal involvement because we had overfished the surfclam resource. In the past 39 years, the surfclam resource has been rebuilt and the two resources have never been overfished nor has overfishing occurred since the initiation of management. The first 13 years of management was hellacious with draconian government micromanagement. Fishing effort was limited to as little as 24 “six-hour days” a year. Then in 1990, ITQs were implemented and the fishery went from one of the most intensely micromanaged to one where industry meets with the Mid-Atlantic Council and the Agency only once or twice a year. The clam industry during the last 25 years has been stable and noncontroversial. This fishery is successful without a lot of government intrusion. A former Chief Scientist (Murawski) and the former Director of Policy (Holliday) for NMFS have labeled the fishery as: “one of the best managed fisheries in the US – if not the world”.

Efforts were made by the FMAT at the initiation of this FMP more than half a decade ago to develop cost estimates of the “with and without” comparisons of managing this fishery. Attempts were made by the FMAT to compare the costs in 1989 (prior to ITQs) to those at the

time (2008). This comparison proved extremely difficult for the Agency to generate reasonable numbers. The hearing draft provides no information at all concerning the pre-ITQ level of expense, and therefore a comparison of “incremental” costs for administering an ITQ plan cannot be evaluated.

While actual quantification of the before and after LAP costs of management have not been successfully generated, the above cited GAO conclusion and even the acknowledgement by the Regional Office (letter to Chairman Robins from RA Kurkul of September 30, 2009) that: “It is widely known that the SC/OQ fishery was more costly to manage and enforce prior to the ITQ system” would indicate negative incremental costs.

An invited presentation by Council staff (Drs. Moore, Montanez and Hoff,) at the 2011 national meeting of the American Fisheries Society attempted to generate qualitative comparisons of pre and post ITQ implementation and included various factors that impacted the Mid-Atlantic Council from staff time, to Council time, to Federal Register notices generated, to meetings with industry. Nearly an ORDER OF MAGNITUDE decrease in Council involvement with the surfclam and ocean quahog management occurred post ITQ. Enforcement cost decreases are likely to be even greater since there is no Coast Guard cutter or helicopter enforcement needed at sea any longer.

These huge post ITQ cost savings must be acknowledged! Agency costs savings are continually occurring nearly annually also. Electronic reporting for both the fishermen and processors, VMS, and other efficiencies -- fully supported and often initiated by industry -- contribute to the Agency saving hundreds of thousands of dollars annually from the management efforts prior to ITQs. The clam industry had done everything in their power to make this system work seamlessly and efficiently and they should not be punished for working so closely with the Council and the Agency to create a simple management plan that is nearly effortless to manage and enforce. The clam industry has always been the leader in fisheries management and protecting the clam resources. The fishery and management agencies are all better off because of it.

In summary, the law and NMFS policy require “incremental” cost recovery attributable to a LAP. Incremental costs were designed to and have decreased since 1990. The NMFS needs to acknowledge this fact and simply discontinue their pursuit of this issue. The Council should be steadfast in their demands that only incremental costs should be considered. Thus Alternative 1 should be adopted to maintain the status quo with no fee recovery, because no legal basis, or factual foundation, for the collection of such fees has been offered or demonstrated.

Should the NMFS not acknowledge the law and their own policy and switch to incremental costs and the Council not decide on Alternative 1, then our clients would be forced to support Alternative 4. That is the only alternative that distributes the costs fairly to everyone and it is the most economically efficient of the alternatives. Alternative 4 is most efficient because it would

require the least administrative effort to collect the fees. Alternative 4 would result in less overall program expense, which they support, because the expense will ultimately be borne by the industry. Additionally, Alternative 4 is the fairest proposal because it ensures that all who benefit from the ITQ program pay for a share of its administrative expense.

However, should the Council not support Alternative 1 and should the Agency NOT drop this issue, I have three specific recommendations on cost recovery:

- 1) NMFS needs to be totally transparent as to what the fees are going to be. The FMP currently estimates cost recovery of around \$100k, but it has analyses of as much as \$1.57 million annually (3% maximum). Previous estimates during the past decade from the RO have been \$45K and \$238K. Estimates vary widely and transparency of the costs would go far in the education of the industry and garnering their support.
- 2) Annual increases should be capped. The tilefish FMP cost recovery increased threefold in ONE year. Threefold increases are not easily budgeted for in any business and please remember my general introductory comment on stability and predictability.
- 3) Industry is very concerned that new costs will simply be added to any cost recovery estimate and desire to have any additional costs run through the Advisory Committee and actually require a framework amendment for anything that is excessive.

BIOLOGICAL REFERENCE POINTS (BRPs)

As pointed out by RO personnel at the April 15, 2014 FMAT meeting this is not a mandated action and is purely "subjective" for the Council to deliberate. When new BRPs are generated at a SARC/SAW, staff has always presented them to the Council and they have been used in quota setting. National Standard 1 does not allow overfishing and National Standard 2 (use of best scientific information) will always trump any existing reference point in an FMP.

Surfclams live for 30+ years and ocean quahogs live for a hundred plus years. The longevity of these species' life spans far exceed those of finfish like summer flounder, scup, and black sea bass and the standards used for those fish need not necessarily be mandated for these two invertebrates. There is plenty of time for these two long lived invertebrates to prevent overfishing if the biomass decreases significantly. The surfclam quota has been the same since 2004 while the ocean quahog quota has remained unchanged since 2005. Industry does not want the ability to rapidly change the annual quotas but rather wants STABILITY for the industry. They are willing to forgo additional quota for that stability.

Rapidly changing BRPs would merely result in unnecessary paperwork and potentially dangerous decision making. Industry likes the situation that is in place now, with conscientious and deliberate thought through the formal FMP amendment process. There should be substantial public/industry input into the process. Dangerous decision making could result from

the types of “peer review” that would be permitted under the alternatives. Industry was shaken to its core by the MAFMC SSC peer-review of the in May 2013. Comments from knowledgeable scientists, but who know little or nothing about the surfclam/ocean quahog resource and deliberated only an hour should NOT be used to replace NEFSC peer-reviewed (days long) science associated with a benchmark stock assessment. Only the wise intervention of the SSC Chair saved an unjustified quota reduction. The system that exists now works for the resource and everyone. The summer flounder/scup/black sea bass model with its rapid response is not necessary for long lived species.

Thus, industry supports the No Action alternative 5.2.1.

OPTIMUM YIELD (OY) RANGE

The Council’s ACL/AM Amendment removed the lower end of the OY range and thus the Council can recommend any quota, including setting the catches at 0 in order to prevent overfishing. At the April 2014 FMAT meeting RO personnel also pointed out that this is a “subjective” component of this FMP

The upper end of the OY range for these two species are numbers that industry members support and do not want changed. They like the idea of a formal FMP amendment that requires public and industry input into the process. The quota for surfclams currently could be double or triple what it is currently, but industry does not want all the uncertainty associated with large scale annual quota changes – especially if they are simply due to something as ephemeral as changes in model usage. The clam fishery is proud to have more clams die from natural causes than the fishermen harvest.

With the requirements specifically to meet National Standards 1 and 2, the ability to have 0 catches and the concern by industry about large scale quota increases – one has to ask the question that RO personnel asked at the FMAT meeting in April 2014: “Aside from “consistency” among various FMPs, what is the problem with the OY range?”

Thus, industry again supports the No Action alternative 5.3.1.

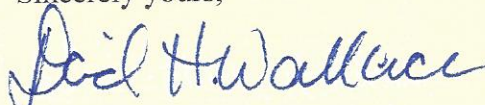

Finally, I would like to say a few words about the recent deletion of EFH consideration from this Amendment. It is understandable that the Council now considers it more effective to produce an Omnibus EFH Amendment to address all of their managed species at once. This is the approach of the NEFMC and while an omnibus approach may be cost effective, delays are almost certain to happen – witness the NEFMC decade plus long efforts that are ongoing. The MAFMC unanimously approved the identification and description of new EFH, as well as, the fishing gear impacts at their October 2009 Council meeting. Updating those issues with one more survey

years' worth of data would not be too difficult and would provide some expedience for this issue. EFH regulations require a 5 year review and the last time EFH was addressed was in Amendment 13 in 2003. As pointed out by RO personnel at last spring's FMAT meeting, this is one of the "required" objectives of this Amendment and it seems a shame for the Council and its staff to be spending time on "subjective" rather than "required" FMP components.

In summary, the one useful and required component (EFH) of this FMP has recently been removed. Nothing in this Amendment will provide additional benefits to either the surfclam or ocean quahog resources or to the fishermen and processors that depend on these two resources. Industry wants the Agency to acknowledge their own policy pertaining to cost recovery and drop their pressure on the Council to collect something other than incremental costs. Industry supports the no action alternative for both BRP and OY. The management of this industry has been successful for the past 25 years because the plan is simple and there are limited rules, but should someone break the rules, loss of quota can occur and thus punishment is severe. This is good and industry does not think anything in this Amendment will improve the management. This is bureaucratic change for NO beneficial reason.

Thank you for your consideration of these comments. Please do not hesitate to contact me should you have any questions.

Sincerely yours,

David H. Wallace

Re: Cost Recovery Amendment Comments

Dear Dr. Moore:

Truex Enterprises has been in the clam industry for 40 years and operate a number of surf clam and ocean quahog vessel working out of Atlantic City and New Bedford. We also own both surf clam and ocean quahog ITQs.

Please consider these responses to the Council's efforts on the Cost Recovery Amendment. There are three issues in this Amendment and we believe that the preferred alternative should be the No Action alternative on each issue. We do not believe there is any reason at all for this amendment as it will not benefit the clam resources or the industry at all. It is simply increase in government expansion.

We were heavily involved in these fisheries before ITQs went in effect in 1990 and the costs were outrageous. Constant meetings, constant fighting, limited fishing, and huge government enforcement all occurred. While we opposed ITQs, the system has worked great. We fish year round whenever the plants need clams, we don't have to attend endless boring meetings, and our costs and the government costs have really gone down. Total costs to the fishermen have certainly gone down and I am sure that they have gone down for the government as well. I understand that "incremental" costs are what you have to collect and cannot understand how any comparison of costs before the ITQ and after the ITQs could result in anything but a SAVINGS. Thus, I support Alternative 1 No Action.

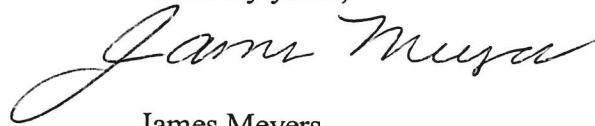

The other two issues – biological reference points and optimum yield – should also not be changed. One of the reasons that ITQs has worked well is that the industry generally trusts the management because we were initially sold on the fact that limited management would occur and that what did occur would have full industry involvement with all the decisions. Quick action by the Council without industry involvement, as proposed for these two issues, flies in the face of that industry involvement. Don't do it!

Truex Enterprises
PO Box 727
Manahawkin, New Jersey 08050

ATLANTIC SURFCLAM & OCEAN QUAHOG AMENDMENT XX COMMENTS!

IIN MY OPINION AN AMENDMENT TO THE CLAM PLAN SHOULD; contain / restrain, the management area for mid Atlantic fishery management at Carolina Virginia line & north.

Reason: In 1980 North Carolina did not have a vote on MAFMC. NMFS collected data differently in south east region VS. Northeast region & line of data collection, stopped at Carolina Virginia line. North Carolina clam fishermen & landings from the ocean were not documented BUT did occur. Were meetings were held in NC during the development of this plan?

NO commercial benefit from the clams off North Carolina can be realized by North Carolina Fishermen or businesses for the resource existing in Federal Waters off NC under the present management system.

{BUY CLAM QUOTA / ITQ } only reflects;

A Monopoly created by the present clam management system.

PROOF! Prior to management CLAMS & CLAM STRIPS WERE THE CHEAPEST SEAFOOD ON MENUES. CLAM SOUP WAS PRODUCED BY A NUMBER OF SOUP COMPANIES AT REASONABLE PRICES.

Clam management under the ITQ system is a monopoly of public resource for a select few, that manipulated / contrived to corner the market on clams. The MAFMC allowed a public resource to become private in perpetuity! IFQ & ITQ should have only been granted for a given number of years, unless family members continues to run the boats. Sale of IFQ or ITQ should have only been for a given number of years {sun set Claus} Then the resource went back in a lottery where men from the deck or boat owners could apply for the lottery. The American public has paid more for clams; because of the present MONOPOLY management system.

All clams now harvested come from a 10 square mile area; showing all the untruths put forward to justify Monopoly Management. The exygenous event off NJ proved the "clam science incorrect". Within 18 years the resource recovered, not hundreds of years,

IT IS REQUESTED THAT THE CLAM MANAGEMENT AREA FOR THE MID ATLANTIC FISHERY MANAGEMENT COUNCIL STOP AT THE CAROLINA VIRGINIA LINE.

This will allow a fisherman processor regulated clam fishery off NC that will result in cheaper prices of clams & clam strips for the American public.

NO COST RECOVERY WILL BE NECESSARY WITH A FISHERMAN / PROCESSOR MANAGED RESOURCE FROM NORTH CAROLINA SOUTH.

The 10 square mile harvest area proves optimum yield is not being realized from the fishery. Millions of unharvested pounds exist created by the present management system. A alternate system of fishermen / processor managed off North Carolina could be allowed to show the flaws of a monopoly management system of a PUBLIC RESOURCE.

The above are my personal opinions and should not reflect on any association or organization I may be associated with.

James Fletcher 123 apple Rd. Manns Harbor NC 27953 Oct 10 2014

DRAFT AMENDMENT XX ("COST RECOVERY")
TO THE
ATLANTIC SURFCLAM AND OCEAN QUAHOG
FISHERY MANAGEMENT PLAN

**(Includes Environmental Assessment, Regulatory Impact Review, and
Initial Regulatory Flexibility Analysis)**

November 2014

Mid-Atlantic Fishery Management Council

in cooperation with

the National Marine Fisheries Service

Draft adopted by MAFMC: October 7, 2014

Final adopted by MAFMC: XXXXXXXX

Draft submitted to NOAA: XXXXXXXX

Final approved by NOAA: XXXXXXXX

**A Publication of the Mid-Atlantic Fishery Management Council pursuant to National
Oceanic and Atmospheric Administration Award No. NA10NMF4410009**

1.0 EXECUTIVE SUMMARY

This document was prepared by the Mid-Atlantic Fishery Management Council (Council) in consultation with the National Oceanic and Atmospheric Administrations (NOAA) National Marine Fisheries Service (NMFS), hereafter referred to as NOAA Fisheries throughout this document. The purpose of this action (Amendment) is to implement measures for collecting fees and recovering costs associated with the management of the Atlantic surfclam and ocean quahog individual transferrable quota (ITQ) fisheries, to implement measures that facilitate incorporation of revised stock status determination criteria (i.e., biological reference points) for surfclams and ocean quahogs into the Fishery Management Plan (FMP), and to implement measures that would modify or eliminate the optimum yield (OY) ranges for surfclam and ocean quahog currently in the FMP.

Summary of Alternatives

The Council analyzed the biological impacts, habitat (EFH) impacts, impacts on Endangered Species Act (ESA)-listed and Marine Mammal Protection Act (MMPA) protected species, and the social and economic impacts of the Council-considered alternatives. A detailed description and discussion of the expected environmental impacts resulting from each of the alternatives, as well as any cumulative impacts, considered in this document are provided in section 7.0

The following section presents a summary of the differences amongst the alternatives under consideration, and a qualitative summary of expected impacts (Boxes ES-1 and ES-2). For purposes of impact evaluation, No action (*Status Quo*) alternatives are compared to the baseline condition, while all other alternatives are compared to the No action/*Status Quo* alternative.

Box ES-1. Summary comparison of the differences in surfclam and ocean quahog alternatives under consideration in this amendment.

Issue	Alternatives	Main Differences in Alternatives
Cost Recovery	Alternative 1 (No action/ <i>Status Quo</i>)	No cost recovery program.
	Alternative 2 (ITQ tag holder pays via a federally permitted dealer)	<i>Who pays?</i> Tag holder pays fee at the point of landing. <i>Who collects fee?</i> Dealer collects fee at point of landing and submits payment to NOAA Fisheries.
	Alternative 3 (ITQ shareholder and tag holder pays; two-tiered approach)	<i>Who pays?</i> All shareholders (permanent ITQ allocation holder) have a portion of fee assessed proportionate to the amount of allocation held by the shareholder, regardless of whether ITQ were fished or not. Remaining part of fee is collected from tag holders at point of landing. <i>Who collects fee?</i> Shareholder pays portion to NOAA Fisheries. Dealer collects other portion of fee from tag holder at point of landing and submits payment to NOAA Fisheries.
	Alternative 4 (Shareholder pays directly; equal fee per share)	<i>Who pays?</i> All shareholders (permanent ITQ allocation holder) pay NOAA Fisheries an equal fee per share, regardless of whether the shares were fished or not. <i>Who collects fee?</i> Shareholder pays NOAA Fisheries directly.
	Alternative 5 (Shareholder pays; tilefish model)	<i>Who pays?</i> Shareholder pays NOAA Fisheries fee based on landed value for shares held. <i>Who collects fee?</i> Shareholder pays NOAA Fisheries directly.
Administrative Mechanism to Update Biological Reference Points	Alternative 1 (No action/ <i>Status Quo</i>)	Requires that reference points be updated in the FMP through an Amendment process.
	Alternative 2 (Redefine the Status Determination Criteria)	Would not require an Amendment process, but status determination criteria must meet Council's standards for consistency with National Standards 1 and 2 definitions and peer review.
Optimum Yield Range	Alternative 1 (No action/ <i>Status Quo</i>)	Council must do Framework to modify OY Range (stays in FMP); Quotas may be set lower than OY bounds if acceptable biological catch (ABC) is lower, but cannot be set higher without doing a Framework; Inconsistent treatment of upper and lower bounds of OY range; ABC can be lower than plan OY, which is not consistent with NOAA Fisheries interpretation that scientific and management uncertainty must be addressed to achieve OY.
	Alternative 2 (Remove OY Range from FMP; Advisors Recommend)	No Framework required; OY range removed from FMP; Removes inconsistencies with OY and ABC; OY value or range would be recommended by advisors as part of specifications process.
	Alternative 3 (Link Upper OY Range to ABC Recommendations)	Council must do Framework to modify OY range (stays in FMP); Upper bound of OY = ABC; At lower bound, Council can set quotas lower if ABC is less than the OY range; ABC can be lower than plan OY, which is not consistent with NOAA Fisheries interpretation that scientific and management uncertainty must be addressed to achieve OY.

Box ES-2. Overall qualitative summary of the expected impacts of various surfclam and ocean quahog alternatives considered in this document.

Issue	Alternatives	Biological	Habitat	ESA-Listed ad MMPA Protected Resources	Socio-economic
Cost Recovery	Alternative 1 (No action/ <i>Status Quo</i>)	Neutral (0)	Neutral (0)	Neutral (0)	Neutral (0)
	Alternative 2 (ITQ tag holder pays via a federally permitted dealer)	Neutral (0); administrative in nature	Neutral (0); administrative in nature	Neutral (0); administrative in nature	Negative (-); fishermen revenues could potentially decrease by up to 3 percent of ex-vessel value
	Alternative 3 (ITQ shareholder and tag holder pays; two-tiered approach)				
	Alternative 4 (Shareholder pays directly; equal fee per share)				
	Alternative 5 (Shareholder pays; tilefish model)				
Administrative Mechanism to Update Biological Reference Points	Alternative 1 (No action/ <i>Status Quo</i>)	Neutral (0) to Slight Negative (-) because would not allow for updates to reference points in FMP when warranted without Amendment (not timely action)	Neutral (0)	Neutral (0)	Neutral (0)
	Alternative 2 (Redefine the Status Determination Criteria)	Neutral (0) to Slight Positive (+) because of more timely and efficient use of updated BRP by management system	Neutral (0); administrative in nature	Neutral (0); administrative in nature	Neutral (0); administrative in nature
Optimum Yield Range	Alternative 1 (No action/ <i>Status Quo</i>)	Neutral (0); administrative in nature	Neutral (0); administrative in nature	Neutral (0); administrative in nature	Neutral (0); administrative in nature
	Alternative 2 (Remove OY Range from FMP; Advisors Recommend)				
	Alternative 3 (Link Upper OY Range to ABC Recommendations)

4.0 INTRODUCTION AND BACKGROUND

This document was developed in accordance with the Magnuson-Stevens Fishery Conservation and Management Act (MSA)¹ and National Environmental Protection Act (NEPA), the former being the primary domestic legislation governing fisheries management in the U.S. Exclusive Economic Zone (EEZ), and the Atlantic Surfclam and Ocean Quahog Fishery Management Plan (FMP). The management regime and objectives of the fishery are detailed in the FMP, including any subsequent amendments, and are available at: <http://www.mafmc.org>.

4.1 PURPOSE AND NEED OF THE ACTION

The purpose of this action is to implement measures for collecting fees and recovering costs associated with the management of the Atlantic surfclam and ocean quahog individual transferrable quota (ITQ) fisheries and to ensure the fishery management plan (FMP) is in compliance with the MSA. The MSA requires fees be recovered for incremental costs directly related to management, data collection and analysis, and enforcement of ITQ programs. The need for this action is to ensure that fishermen that hold ITQs are bearing at least part of the costs related to the management of their ITQ fishery.

In addition, a purpose of this action is to implement measures that facilitate incorporation of revised stock status determination criteria (i.e., biological reference points) for surfclams and ocean quahogs into the fishery management plan (FMP). This action is needed to ensure that the Council is applying the most updated information to management through the FMP to ensure that quota levels are set properly and that stocks are managed to prevent overfishing.

Another purpose of this action is to implement measures that would modify or eliminate the optimum yield (OY) ranges for surfclams and ocean quahogs. This action is needed to ensure the Council has the flexibility to set catch and landings limits, and commercial quotas consistent with the MSA without a potential conflict between the OY ranges that currently exist in the FMP and the Scientific and Statistical Committee (SSC) recommendations for acceptable biological catch (ABC). This is further needed to ensure that stocks continue to be managed to prevent overfishing.

4.2 EXISTING COST RECOVERY PROGRAMS

The MSA requires NOAA Fisheries to collect fees to recover the “actual costs directly related to the management, data collection, and enforcement” of an Individual Fishing Quota (IFQ) program (16 U.S.C. 1854(d)(2)). NOAA Fisheries has interpreted the term to mean those costs that would not have been incurred but for the ITQ program (i.e., the incremental costs). However, another way to interpret the term “actual costs directly related to” is full costs. Under a “full cost” approach, NOAA Fisheries could have recovered more costs of managing the ITQ program. NOAA Fisheries has determined the recoverable costs associated with the management, enforcement, and data

¹ Magnuson-Stevens Fishery Conservation and Management Act (MSA), portions retained plus revisions made by the Magnuson-Stevens Fishery Conservation and Management Reauthorization Act of 2006 (MSRA), and available at: http://www.nmfs.noaa.gov/sfa/magact/MSA_Amended_2007%20.pdf

collection in the surfclam and ocean quahog ITQ program include only the incremental costs of the ITQ program, and not costs that would still have been incurred in the administration of the surfclam and ocean quahog fisheries if there was no ITQ program. Furthermore, costs associated with the initial development of the ITQ program are not included in recoverable costs. The inclusion of one-time startup costs associated with the initial development of a new management system would greatly increase the fee in the first year of any ITQ program.

The current management regime in the surfclam and ocean quahog ITQ fisheries is intended to allow these fisheries to operate at the lowest possible cost (e.g., fishing effort, administration, and enforcement) given the FMP objectives. NOAA Fisheries is required by law to recover the fees associated with the incremental costs of managing the ITQ program for these species. The same cost recovery approach has already been implemented for the golden tilefish and Atlantic scallop fisheries in the NOAA Greater Atlantic Regional Fisheries Office (GARFO) region. Recoverable costs associated with management and enforcement include the following categories: personnel², travel and transportation, printing, contracts, supplies, equipment, and other categories. Under the tilefish IFQ cost recovery program, fees were collected in 2010 (\$21,438), 2011 (\$21,353), 2012 (\$14,242), and 2013 (\$35,966). Under the Atlantic scallop IFQ cost recovery program, fees were collected in 2011 (\$82,556), 2012 (\$107,015), and 2013 (\$118,510). The 2013 annual report of the IFQ cost recovery program for tilefish and Atlantic sea scallop are shown in Appendix C.

² Personnel cost is calculated by GARFO by multiplying hours spent by staff on tasks directly related to the IFQ program, with the hourly salary rates of those individuals. Salary rates include the Government's share of benefits, prorated. Contract expenses is calculated by GARFO as the costs of contract employees prorated for the percentage of time the contract employees spent on tasks directly related of the IFQ program.

5.0 MANAGEMENT ALTERNATIVES

Comprehensive descriptions of the current regulations for surfclams and ocean quahogs as detailed in the Code of Federal Regulations (CFR) are available through the website for the NOAA Fisheries Regional Office (GARFO): <http://www.greateratlantic.fisheries.noaa.gov/regs/fr.html>.

5.1 Cost Recovery Alternatives

NOAA Fisheries is required under the MSA to collect fees to recover the costs directly related to management, data collection and analysis and enforcement of limited access privilege programs.³ Under section 304(d)(2)(A) of the Act, the Secretary is authorized to collect a fee to recover these costs. Throughout the description of alternatives, it should be noted that the term shareholder refers to the permanent ITQ allocation holder. ITQ cage tags are issued to the shareholder and these tags may or may not be fished during the fishing year. The tags may also be leased to other entities. The shareholder may harvest surfclams and/or ocean quahogs on his or her own vessel, or pay someone else to provide harvesting services. Therefore, the term tag holder is used to describe an entity that actually holds the tags, but may or may not be the actual ITQ shareholder.

The following provisions of the ITQ cost recovery program would apply to all the proposed alternatives:

- Under alternatives 2-5 the greatest ITQ fee that could be collected is 3 percent of the ex-vessel value of shellfish harvested, which is the maximum fee amount allowed by section 304(d)(2)(B) of the MSA.
- ITQ fees collected would be deposited in the Limited Access System Administrative Fund (LASAF) established in the U.S. Treasury.
- Separate accounts would be created within the LASAF to ensure that the funds from the ITQ cost recovery are used only to pay for the actual costs directly related to management, data collection, analysis, and enforcement costs of the NOAA Fisheries Northeast Region Atlantic Surfclam and Ocean Quahog ITQ Programs, as described in the MSA.⁴
- An annual ITQ report would be generated.⁵ This report will be available online and on request from NOAA Fisheries. A copy of the report will be provided to the Council.

³ A limited access privilege is a permit, issued as part of a limited access system, to harvest a quantity of fish expressed by a unit or units representing a portion of the total allowable catch of the fishery that may be received or held for exclusive use by a person. This includes individual fishing quotas (IFQ). An ITQ is an IFQ program where privileges can be transferred subsequent to initial allocations.

⁴ Up to 25- percent of the fees collected can be used for purchasing quota for small-vessel fisherman or quota for new entrants into the fishery, if such a program is submitted by the Council and approved by NOAA Fisheries (as described by paragraph 303A(g) of the MSA).

⁵ The report would include annual information regarding the amount and value of Atlantic surfclam and ocean quahog landed during the fishing year, the associated cost recovery fees, and the status of those fees. This report would also

- The ex-vessel value⁶ of an ITQ landing would equal the sum of all payments⁷ of monetary worth made to fishermen for the sale of the shellfish under the tags provided, during the fishing year.
- NOAA Fisheries will bill for the fees to be collected for the fishing year to those required to pay (i.e., dealers, shareholders, or tag holders depending on the alternative considered). Bills may be mailed or made available electronically via the internet. Payment of the ITQ fee must be made at the end of the fishing season. Payments of the ITQ fee must be made electronically via the Federal web portal, www.pay.gov, or other internet sites as designated by the Regional Administrator (RA⁸). The RA has discretion to authorize payment by check, if necessary. NOAA Fisheries will address any payment liabilities, as needed.
- NOAA Fisheries will estimate the ITQ percentage fee to be applied for the first year of implementation of cost recovery, based on prior year actual costs and the anticipated ex-vessel value of the fishery.
- The RA would review the cost recovery fee annually to determine if adjustment is warranted. Those to be issued bills (i.e., dealers, shareholders, or tag holders depending on the alternative considered) will need to know what ITQ fee percentage will be applied, the RA would publish a notification of the ITQ fee percentage (or ITQ per tag fee if applicable) in the Federal Register each year, prior to the start of the upcoming fishing year. This will be based on prior year estimates of costs. At the end of the fishing year, the Regional Administrator would determine if a fee adjustment is warranted. Factors considered in the review include the catch subject to the ITQ cost recovery, projected ex-vessel value of the catch, costs directly related to the management, enforcement, and data collection of the ITQ program, and expected nonpayment of fee liabilities. If a fee adjustment is warranted, the RA would adjust the ITQ fee percentage in the next fishing year.

detail the costs incurred by NOAA Fisheries, including the calculation of the recoverable costs for the management, enforcement, and data collection, incurred by NOAA Fisheries during the fishing year.

⁶ “Value” refers to the worth, in U.S. dollars, of any amount of landed ITQ surfclam and ocean quahog as determined by the sale, or potential economic return for the sale, of those shellfish. Actual ex-vessel value would be the amount of money received as payment for the tag holder’s ITQ shellfish sold, as reported by a federally permitted dealer. In other words, this ex-vessel value amount will not be averaged with the other dealer prices for the purposes of calculating cost recovery fees.

⁷ This would include any retro-payments (e.g., bonuses, delayed partial payments, post-season payments) made to the tag holder (or shareholder if not one in the same) for previously landed surfclams and/or ocean quahogs. Retro-payments would be part of the ex-vessel value and as such have a fee liability. If they were received after the initial payment, but during the same fishing year, the cost recovery fee for those retro-payments also would be due at the end of the fishing season. It is the responsibility of the dealer to update any previously reported landing report to reflect these “retro-payments”.

⁸ The reason for the 100- percent electronic fee collection system is to minimize paper transactions, and reduce the administrative burden that would be charged to the industry. Presently, the NOAA Fisheries Greater Atlantic Regional Fishery Office is not equipped to process paper collections. Instructions for electronic payment will be made available on both the payment website and the paper bill. Payment options will include payment via a plastic card (e.g. Visa, MasterCard, Discover, etc.), or direct automated clearing house (ACH) withdrawal from a designated checking account.

- Each year the RA would publish a notification of the ITQ fee percentage and/or per-tag fee for the next fishing year in the Federal Register.
- Those issued bills will provide payment to NOAA Fisheries at the end of the fishing season. Early payment may be allowed,⁹ but it would not relieve a federally permitted dealer, tag, or shareholder holder of any associated fee collection or reporting requirement.

5.1.1 Alternative 1 (No action - No Cost Recovery)

Under this alternative, cost recovery would not be implemented for the Atlantic surfclam and ocean quahog ITQ fisheries. This means no fees would be collected to cover the costs directly related to management, data collection and analysis, and enforcement of ITQ programs. This alternative would be contrary to the Congressional mandate to collect fees for ITQ programs as specified in the MSA.

5.1.2 Alternative 2 (ITQ tag holder pays via a federally permitted dealer)

Alternative 2 would implement a cost recovery system where federally permitted dealers would collect the fee to be recovered at the point of purchase when the tag holder uses the cage tags to land surfclams or ocean quahogs. The person that submits the tags at the point of landing (i.e., tag holder) would be responsible for paying the fee to the dealer. This would include tag holders that are, or are not, the actual shareholder.

The dealer would be responsible for collecting the fees from the tag holder at the point of purchase and submitting the payment to NOAA Fisheries at the end of the fishing season. The dollar amount of the fee due would be determined by multiplying the ITQ fee percentage by the actual ex-vessel value of each ITQ landing made using tags.

5.1.3 Alternative 3 (ITQ shareholder and tag holder pays; two-tiered approach)

Alternative 3 would implement a cost recovery system where shareholders (permanent ITQ allocation holders) would have a percentage of the fee assessed proportionate to the amount of allocation (shares) held by the shareholder. This initial portion of the fee would be paid by all shareholders regardless of whether their ITQ was fished or not. The remaining part of the fee would be paid via federally permitted dealers that would collect the fee to be recovered at the point of purchase when the tag holder uses the tags to land surfclams or ocean quahogs. Whoever holds the tags at the point of landing (i.e., tag holder) would be responsible for paying the fee to the dealer. This would include tag holders that are, or are not, the actual shareholder.

The dealer would be responsible for collecting fees at the point of purchase and submitting the payment to NOAA Fisheries at the end of the fishing season. The dollar amount of the fee due

⁹ Currently there is not a mechanism at GARFO to allow early payments. Payment is allowed once the bills are sent out and the payment system for cost recovery is not accessible all year. This could increase administrative costs.

would be determined by multiplying the ITQ fee percentage by the actual ex-vessel value of each ITQ landing made using tags.

5.1.4 Alternative 4 (Shareholder pays directly; equal fee per share)

Alternative 4 would implement a cost recovery system where the shareholders (permanent ITQ allocation holders) would pay the fee directly to NOAA Fisheries, and the fee would be shared by all shareholders regardless of whether the ITQ was fished or not.

The dollar amount of the per-share fee would be determined by dividing the total recoverable costs of managing the fishery by the number of ITQ shares. The shareholder would pay the fee for all of the held shares directly to NOAA Fisheries. The total recoverable costs could not exceed 3 percent of the total ex-vessel value of ITQ landings for the surfclam or ocean quahog fisheries.

5.1.5 Alternative 5 (Shareholder pays; tilefish model)

Alternative 5 would implement a cost recovery system where the shareholder (permanent ITQ allocation holders) would pay the fee directly to NOAA Fisheries, and the fee would be based on the landed value of surfclams and ocean quahogs associated with the shares held, even if the associated tags are leased and subsequently landed by another party.

The dollar amount of the fee due would be determined by multiplying the ITQ fee percentage by the total ex-vessel value of ITQ landings. The shareholder would pay the fee for the landed product associated with their held shares (i.e., their annual tags that are used to land product), directly to NOAA Fisheries.

5.1.6 Considered but rejected from further analysis

The Fishery Management Action Team (FMAT) considered an alternative, where the ITQ permit holder will pay the fee associated with the cost recovery program in order to obtain the cage tags at the beginning of the fishing year based on assumed landings for the upcoming fishing year. This was rejected because the MSA stipulates that the recovered fee must be based on the landings, and this implies that those landings and tag use must have already occurred. The FMAT discussed the new entrant promotion program, where up to 25 percent of the fees collected can be used for purchasing quota for small-vessel fisherman or quota for new entrants into the fishery, if such a program is submitted by the Council and approved by NOAA Fisheries. However, the Council has not indicated interest in implementing this program therefore it is not included in the alternatives presented by the FMAT. A lien registry could be used to identify shareholders more accurately given the numbers of transactions with tags that occur in this fishery; however, a formal catch share lien registry has never been implemented by NOAA Fisheries.

5.2 Administrative Mechanism to Update Biological Reference Points Alternatives

Under National Standard 1, the MSA requires that each Council FMP define overfishing as a rate or level of fishing mortality that jeopardizes a fishery’s capacity to produce maximum sustainable yield (MSY) on a continuing basis, and defines an overfished stock as a stock size that is less than a minimum biomass threshold. The MSA also requires that each FMP specify objective and measurable status determination criteria for identifying when stocks or stock complexes covered by the FMP are overfished. To fulfill the requirements of the MSA, status determination criteria are comprised of two components: 1) a maximum fishing mortality threshold (section 600.310 (d)(2)(i)) and 2) a minimum stock size threshold (section 600.310 (d)(2)(ii)).

5.2.1 Alternative 1 (No Action)

Under this no action alternative, the status determination criteria, which include a maximum fishing mortality threshold (MFMT; F_{MSY} ; or reasonable proxy thereof) and the minimum stock size threshold (MSST; or reasonable proxy thereof) for each species managed under this FMP would remain unchanged and as defined for ocean quahogs and surfclams under Amendment 12 to the FMP (1998) and Amendment 13 to the FMP (2003). These definitions of status determination criteria have remained unchanged for these species since they were described in the FMP in 1998 and 2003, and may only be modified by an Amendment to the FMP (Table 1).

Overfishing for these species is currently defined to occur when the fishing mortality rate exceeds the threshold fishing mortality rate of F_{MSY} . Since F_{MSY} cannot be reliably estimated for surfclams and ocean quahog stocks, proxies are used.

Table 1. Definitions for the MFMT and MSST for surfclams and ocean quahogs.

Stock Status Determination Criteria		
Species	Current Definition In FMP	Needs To Be Updated in FMP
Surfclams - MFMT	$F=M$ (2003)	$F=M$ (2013)
Surfclams - MSST	$B_{Threshold} = \frac{1}{4}$ the 1999 biomass (2003)	$B_{Threshold} = \frac{1}{4}$ the 1999 biomass (2013)
Ocean quahogs - MFMT	$F_{25\%MSP}$ (1998)	$F_{45\%MSP}$ (2009)
Ocean quahogs - MSST	$B_{Threshold} = \frac{1}{4}$ the virgin biomass of the whole stock; (1998)	$B_{Threshold} = 40\%$ of the 1978 whole stock biomass (2009)

For the surfclam and ocean quahog stocks B_{MSY} cannot be reliably estimated; therefore, proxies are used. Updates to the values associated with those definitions may occur when new information becomes available. The Council is not required to undertake any specific action when this occurs, as using the updated values is consistent with National Standard 2.

However, under this no action alternative, incorporation of changes to the status determination criteria would continue to occur through an amendment process as necessary.

5.2.2 Alternative 2 (Redefine the Status Determination Criteria)

Under this alternative, the status determination criteria for each of the species managed under the FMP would be defined as follows.

The maximum fishing mortality threshold for each of the species under the FMP is defined as F_{MSY} (or a reasonable proxy thereof) as a function of productive capacity, and based upon the best scientific information consistent with National Standards 1 and 2. Specifically, F_{MSY} is the fishing mortality rate associated with MSY. The maximum fishing mortality threshold (F_{MSY}) or a reasonable proxy may be defined as a function of (but not limited to): total stock biomass, spawning stock biomass, total egg production, and may include males, females, both, or combinations and ratios thereof which provide the best measure of productive capacity for each of the species managed under the FMP. Exceeding the established fishing mortality threshold constitutes overfishing as defined by the MSA.

The minimum stock size threshold for each of the species under the FMP is defined as $\frac{1}{2} B_{MSY}$ (or a reasonable proxy thereof) as a function of productive capacity, and based upon the best scientific information consistent with National Standards 1 and 2. The minimum stock size threshold ($\frac{1}{2} B_{MSY}$) or a reasonable proxy may be defined as a function of (but not limited to): total stock biomass, spawning stock biomass, total egg production, and may include males, females, both, or combinations and ratios thereof which provide the best measure of productive capacity for each of the species managed under the FMP. The minimum stock size threshold is the level of productive capacity associated with the relevant $\frac{1}{2}$ MSY level. Should the measure of productive capacity for the stock or stock complex fall below this minimum threshold, the stock or stock complex is considered overfished. The target for rebuilding is specified as B_{MSY} (or reasonable proxy thereof) at the level of productive capacity associated with the relevant MSY level, under the same definition of productive capacity as specified for the minimum stock size threshold.

The definitions for status determination criteria for these species are broadened under this alternative to allow for greater flexibility in incorporating changes to the definitions of the maximum fishing mortality threshold and/or minimum stock size threshold as the best scientific information consistent with National Standards 1 and 2 becomes available. As such, the following describes the potential sources of peer-reviewed scientific advice on status determination criteria and the current process of how that scientific advice will move forward in the development of management advice through the Council's annual specification process.

Specific definitions or modifications to the status determinations criteria, and their associated values, would result from the most recent peer-reviewed stock assessments and their panelist recommendations. The Northeast Regional Stock Assessment Workshop/Stock Assessment Review Committee (SAW/SARC) process is the primary mechanism utilized in the Northeast Region at present to review scientific stock assessment advice, including status determination criteria, for federally-managed species. There are also periodic reviews, which occur outside the

SARC process that are subject to rigorous peer-review and may also result in scientific advice to modify or change the existing stock status determination criteria.¹⁰

These periodic reviews outside the SARC process could be conducted by any of the following listed below, as deemed appropriate by the managing authorities.

- MAFMC SSC Review
- MAFMC Externally Contracted Reviews with Independent Experts (e.g., Center for Independent Experts - CIE)
- NOAA Fisheries Internally Conducted Review (e.g., Comprised of NOAA Fisheries Scientific and Technical Experts from NOAA Fisheries Science Centers or Regions)
- NOAA Fisheries Externally Contracted Review with Independent Experts (e.g., CIE)

The scientific advice developed on stock status determination criteria is then provided to the Council's SSC. The SSC uses this information to develop acceptable biological catch (ABC) recommendations which address scientific uncertainty based on the information provided in the peer reviewed assessment of the stock. These recommendation are then provided to the Council.

The Council's Industry Advisory groups are often engaged to provide additional management recommendations to the Council. The Council can then utilize the management advice from their advisory groups in developing their own recommendations put forward through the regulatory process of setting the annual specifications for the upcoming fishing year, which is the primary mechanism for adjusting management measures to meet the goals of the FMP. The recommendations from the Council can move forward in the specification package to NOAA Fisheries for implementation under their regulatory process. The EA/RIR/FRFA in the annual or multi-year specification document currently provides a thorough analysis of this information and the extent to which the information is applied.

5.3 Optimum Yield Range Alternatives

5.3.1 Alternative 1 (No Action)

Under this alternative, the FMP specified optimum yield (OY) ranges would remain as described in the FMP. The FMP specifies a surfclam OY range from 1.85 - 3.40 million bushels or 14,265 - 26,218 mt be used to set the surfclam commercial quota. For ocean quahog the OY range is 4.00 - 6.00 million bushels or 18,144 - 27,216 mt. The Council must select a commercial quota within this range. Modification to the upper end of the range would require a Framework adjustment. Commercial quotas may be set lower than OY bounds if the SSC sets a lower ABC, resulting in an OY range that is higher than ABC.

¹⁰ For example, in 2006 scientific advice on summer flounder status determination criteria was provided through a NMFS internally conducted review at the "Summer Flounder Assessment and Biological Reference Point Update for 2006." The review panel was composed of experts from NOAA Fisheries and academia.

5.3.2 Alternative 2 (Remove OY Range from FMP; Advisors Recommend)

Under this alternative, the OY ranges would be removed from the FMP and commercial quotas for surfclams and ocean quahogs would continue to be set under the existing system of catch limits. This is consistent with the other FMPs the Council manages; surfclams and ocean quahogs are the only stocks with OY ranges specified in the plan.

As prescribed under this system, the Council may not exceed the ABC recommendations of the SSC, and would continue to specify annual catch limits, targets, and commercial quotas as otherwise described in the FMP. As part of the specifications process, the advisory panel will develop recommendations for commercial quotas, including OY recommendations which will be provided to the Council. For example, this could be completed as part of the advisor's Fishery Performance Report development process.

5.3.3 Alternative 3 (Link Upper Bound of OY Range to ABC Recommendations)

Under this alternative, the upper bound of the OY range for both surfclams and ocean quahogs would be equal to the ABC, which is specified by the SSC for each of these stocks. The FMP prescribes that $ACL=ABC$. As noted in the CFR§648.72, specifications for surfclams and ocean quahogs may be specified below the OY ranges in the FMP, if the ABC recommendation of the SSC limits the ACL to a value less than the minimum of the range indicated. This alternative addresses the potential disconnect at the upper end of the OY range.

5.3.4 Considered but rejected from Further Analysis

The FMAT considered modifying the values in the surfclam and ocean quahog OY ranges; however a more complete biological and economic analysis would be required to do so. The OY ranges in the plan were based on scientific information (stock assessments) and industry input in the 1980's and these data would need to be reevaluated. Even with an updated range, there is still the possibility that the SSC might recommend something above the current OY range and the Council would not be able to develop viable commercial quota recommendation without going through a Framework adjustment process (which takes about a year). Therefore, this approach was considered but rejected from further analysis as it does not address the issue of potential disconnect with the newly implemented catch limit system.

6.0 DESCRIPTION OF THE AFFECTED ENVIRONMENT AND FISHERIES

6.1 Description of the Managed Resources

6.1.1 Description of the Fisheries

The management unit is all Atlantic surfclams (*Spisula solidissima*) and ocean quahogs (*Arctica islandica*) in the Atlantic EEZ. The commercial fisheries for surfclams and ocean quahogs are fully described in Amendment 13 to the FMP (MAFMC 2003). Clam dredges (a bottom tending mobile gear) are utilized in the commercial fisheries for both species. An overview of commercial landings for both species is provided below in Table 2.

Table 2. Federal Surfclam and Ocean Quahog Quotas and Landings: 1998 - 2016.

Year	Surfclams ('000 bu)			Ocean Quahogs ('000 bu)		
	Landings ^a	Quota	% Harvested	Landings ^b	Quota	% Harvested
1998	2,365	2,565	92%	3,897	4,000	99%
1999	2,539	2,565	99%	3,770	4,500	86%
2000	2,565	2,565	100%	3,161	4,500	73%
2001	2,855	2,850	100%	3,691	4,500	84%
2002	3,113	3,135	99%	3,871	4,500	89%
2003	3,241	3,250	100%	4,069	4,500	93%
2004	3,138	3,400	92%	3,825	5,000	79%
2005	2,744	3,400	81%	2,940	5,333	57%
2006	3,057	3,400	90%	3,066	5,333	60%
2007	3,231	3,400	95%	3,366	5,333	65%
2008	2,919	3,400	86%	3,426	5,333	65%
2009	2,602	3,400	77%	3,443	5,333	65%
2010	2,332	3,400	69%	3,554	5,333	68%
2011	2,443	3,400	72%	3,116	5,333	60%
2012	2,341	3,400	69%	3,454	5,333	66%
2013	2,390	3,400	70%	3,201	5,333	61%
2014	359 ^c	3,400	NA	845 ^c	5,333	NA
2015	NA	3,400	NA	NA	5,333	NA
2016	NA	3,400	NA	NA	5,333	NA

^a 1 surfclam bushel is approximately 17 lb. ^b 1 ocean quahog bushel is approximately 10 lb. ^c Incomplete landings year. NA = Not yet available. Source: NOAA Fisheries Clam Vessel Logbook Reports.

Paralytic Shellfish Poisoning (PSP) is a public health concern for surfclams and ocean quahogs. It is caused by saxitoxins, produced by the alga *Alexandrium fundyense* (red tide), that accumulate in shellfish, and has resulted in closures for these fisheries in the Georges Bank Area of the EEZ. NOAA Fisheries recently reopened portions of the closed areas for harvest of surfclams and ocean quahogs for those vessels using a "Protocol for Onboard Screening and Dockside Testing in Molluscan Shellfish" that is designed to test and verify that clams harvested from these areas are safe.¹¹

Additional information on these fisheries can be found in Council meeting materials available at: <http://www.mafmc.org>.

6.1.2 Description of the Stock (Including Status, Stock Characteristics, and Ecological Relationships)

Reports on stock status, including SAW/SARC reports, and assessment update reports are available online at the NOAA Northeast Fisheries Science Center (NEFSC) website: <http://www.nefsc.noaa.gov/>. EFH Source Documents, which include details on stock characteristics and ecological relationships, are available at the following website: <http://www.nefsc.noaa.gov/nefsc/habitat/efh/>.

6.1.2.1 Atlantic Surfclam

The most recent assessment (NEFSC 2013) indicated that the Atlantic surfclam stock was not overfished and overfishing is not occurring relative to the biological reference points. The 2011 $F = 0.027$, below the reference point $F_{MSYPROXY} = M = 0.15$. Stock biomass for the entire resource was estimated to be 1,060,000 mt, slightly above the $B_{MSYPROXY} = 972,000$ mt.

6.1.2.2 Ocean Quahog

The most recent assessment update (Chute et al. 2013) indicated that the ocean quahog stock is not overfished and overfishing is not occurring relative to the biological reference points. The 2011 $F = 0.010 \text{ y}^{-1}$, below the reference point $F_{MSYPROXY} = F_{45\%} = 0.022 \text{ y}^{-1}$. Stock biomass for the entire resource in 2011 was estimated to be 2.96 million mt, above the $B_{MSYPROXY} = 1.73$ million mt. The SSC noted in their May 2013 report to the Council Chair, that the "fishing mortality rate reference point is deemed to be non-credible, both because of the species to which quahogs were compared were inappropriate and because the details of the calculations of spawning-per-recruit for any particular level were poorly justified."

¹¹ For additional information see: <http://www.greateratlantic.fisheries.noaa.gov/nr/2013/August/13clamsreopengbcaphl.pdf>.

6.1.3 Non-Target Species

The term "bycatch," as defined by the MSA, means fish that are harvested in a fishery but that are not sold or kept for personal use. Bycatch includes the discard of whole fish at sea or elsewhere, including economic and regulatory discards, and fishing mortality due to an encounter with fishing gear that does not result in capture of fish (i.e., unobserved fishing mortality).

Northeast Fisheries Observer Program directed trips for surfclams (sample size (N) = 16) and ocean quahogs (N = 30) with discards from 2004-2006, were used to characterize non-target and bycatch species for these fisheries (Chute, T., Pers. Comm., July 3, 2013). For ocean quahogs and surfclams the bulk of the bycatch from the clam dredges is non-living (debris/shell), with a mean of 8 percent live bycatch (range 0-19 percent) for ocean quahogs trips and 3 percent live bycatch (range 0-7 percent) for surfclam trips. For ocean quahog trips, the top live bycatch, ordered by declining contribution, are sea scallop, little skate, skate (unclassified), monkfish, clapper clam, clapper (unclassified), snail (unclassified), spiny dogfish, winter skate, rock crab, Jonah crab, sea star (unclassified), whelk (unclassified), mollusk (unclassified), summer flounder, ocean pout, crab (unclassified), and longfin sculpin. For surfclam trips, the top live bycatch items include sea scallop, ocean quahog, little skate, clapper clam, stargazer (unclassified), monkfish, spiny dogfish, sea star (unclassified), moon snail (unclassified), clapper (unclassified), sponge (unclassified), horseshoe crab, sand dollar, snail (unclassified), winter skate, rock crab, skate (unclassified), and eggs (unclassified). The surfclam and ocean quahog fisheries are targeted fisheries, and live bycatch constitutes a small percent of total bycatch.

6.2 Habitat (Including Essential Fish Habitat)

A description of the habitat associated with the surfclam and ocean quahog fisheries is presented in the appendices of Amendment 13 to the FMP (MAFMC 2003), and a brief summary of that information is given here. The impact of fishing on surfclams and ocean quahogs on habitat (and EFH) and the impact of the surfclam and ocean quahog fisheries on other species' habitat and EFH can be found in Amendment 12 (MAFMC 1998) and 13 to the FMP (MAFMC 2003). Potential impacts associated with the measures proposed in this document on habitat (including EFH) are discussed in section 7.2.

6.2.1 Physical Environment

Detailed information on the affected physical and biological environments inhabited by the managed resources is available in Stevenson et al. (2004). The managed resources inhabit the Northeast U.S. Shelf Ecosystem, which has been described as including the area from the Gulf of Maine south to Cape Hatteras, extending from the coast seaward to the edge of the continental shelf, including the slope sea offshore to the Gulf Stream. The continental slope includes the area east of the shelf, out to a depth of 2000 m. Four distinct sub-regions comprise the NOAA Fisheries Northeast Region: the Gulf of Maine, Georges Bank, the Mid-Atlantic Bight, and the continental slope. The Gulf of Maine is an enclosed coastal sea, characterized by relatively cold waters and deep basins, with a patchwork of various

sediment types. Georges Bank is a relatively shallow coastal plateau that slopes gently from north to south and has steep submarine canyons on its eastern and southeastern edge. It is characterized by highly productive, well-mixed waters and strong currents. The Mid-Atlantic Bight is comprised of the sandy, relatively flat, gently sloping continental shelf from southern New England to Cape Hatteras, North Carolina. The continental slope begins at the continental shelf break and continues eastward with increasing depth until it becomes the continental rise. It is fairly homogenous, with exceptions at the shelf break, some of the canyons, the Hudson Shelf Valley, and in areas of glacially rafted hard bottom. The environment that could potentially be affected by the proposed action overlaps with EFH for the managed resources. The following sections describe where to find detailed information on EFH and any past actions taken in the FMPs to minimize adverse EFH effects to the extent practicable.

6.2.2 Essential Fish Habitat (EFH)

Information on surfclam and ocean quahog habitat requirements can be found in the documents titled, "Essential Fish Habitat Source Document: Atlantic Surfclam, *Spisula solidissima*, Life History and Habitat Characteristics." (Cargnelli et al. 1999a) and "Essential Fish Habitat Source Document: Ocean Quahog, *Arctica islandica*, Life History and Habitat Characteristics" (Cargnelli et al. 1999b). Electronic versions of these source documents are available at this website: <http://www.nefsc.noaa.gov/nefsc/habitat/efh/>. The current designations of EFH by life history stage for surfclams and ocean quahogs are provided here:

Atlantic surfclam juveniles and adults: EFH habitat is defined as throughout the substrate, to a depth of three feet below the water/sediment interface, within federal waters from the eastern edge of Georges Bank and the Gulf of Maine throughout the Atlantic EEZ, in areas that encompass the top 90 percent of all the ranked ten-minute squares for the area where surfclams were caught in the NEFSC surfclam and ocean quahog dredge surveys. Surfclams generally occur from the beach zone to a [water] depth of about 200 feet, but beyond about 125 feet abundance is low.

Ocean quahog juveniles and adults: EFH habitat is defined as throughout the substrate, to a depth of three feet below the water/sediment interface, within federal waters from the eastern edge of Georges Bank and the Gulf of Maine throughout the Atlantic EEZ, in areas that encompass the top 90 percent of all the ranked ten-minute squares for the area where ocean quahogs were caught in the NEFSC surfclam and ocean quahog dredge surveys. Distribution in the western Atlantic ranges in [water] depths from 30 feet to about 800 feet. Ocean quahogs are rarely found where bottom water temperatures exceed 60 °F, and occur progressively further offshore between Cape Cod and Cape Hatteras.

There are other federally-managed species with life stages that occupy essential benthic habitats that may be susceptible to adverse impacts from hydraulic clam dredges; descriptions of these are given in Table 1 of Appendix A (from Stevenson et al. 2004) and are available at: <http://www.greateratlantic.fisheries.noaa.gov/hcd/list.htm>.

6.2.3 Fishery Impact Considerations

Any actions implemented in the FMP that affect species with overlapping EFH were considered in the EFH assessment for Amendment 13 to the FMP (MAFMC 2003). Atlantic surfclams and ocean quahogs are primarily landed by hydraulic clam dredges. Amendment 13 included alternatives to minimize the adverse impacts of fishing gear on EFH (as required pursuant to section 303(a)(7) of the MSA). As stated in section 2.2 of Amendment 13, the prime habitat of surfclams and ocean quahogs consists of sandy substrates with no vegetation or benthic 'structures' that could be damaged by the passing of a hydraulic dredge. In these 'high energy' environments, it is thought that the recovery time following passage of a clam dredge is relatively short. Because of the potential that the fishery adversely impacts EFH for a number of managed species, eight action alternatives (including closed area alternatives) for minimizing those impacts were considered by the Council in Amendment 13.

A panel of experts who participated in a 2001 workshop to evaluate the potential habitat impacts of fishing gears used in the Northeast region concluded that there are potentially large, localized impacts of hydraulic clam dredges on the biological and physical structure of sandy benthic habitats (NEFSC 2002). The Council concluded in Amendment 13 that there may be some adverse effects of clam dredging on EFH, but concurred with the workshop panel that the effects are short term and minimal because the fishery occurs in a relatively small area (compared to the area impacted by scallop dredges or bottom trawls) and primarily in high energy sand habitats. The panel concluded that biological communities would recover within months to years (depending on what species was affected) and physical structure within days in high energy environments to months in low energy environments. The preamble to the EFH Final Rule (50 CFR Part 600) defines temporary impacts as those that are limited in duration and that allow the particular environment to recover without measurable impact.

Additionally, at the time that workshop was held, the overall area impacted by the clam fisheries was relatively small (approximately 100 square nautical miles), compared to the large area of high energy sand on the continental shelf. The closed area alternatives that were considered in Amendment 13 were analyzed for their biological, economic, and social impacts, but given the results of the gear effects analysis in that document (summarized above), the Council concluded that none of them were necessary or practicable. Since 2003, when Amendment 13 was implemented, the area open to surfclam and ocean quahog harvesting has expanded to include a large area on Georges Bank that has been closed due to the presence of the toxin that causes PSP in the tissues of surfclams and ocean quahogs since 1990 (NMFS 2012 and 2013). The effects of this fishery on EFH have not been re-evaluated since 2003.

Amendment 13 to the Northeast Multispecies FMP (NEFMC 2003), developed by the New England Fishery Management Council (NEFMC) and implemented in 2003, prohibited the use of all mobile, bottom-tending gears (including hydraulic clam dredges) in seven habitat closed areas (total area 2,811 square nautical miles) on Georges Bank and in the Gulf of Maine. These regulations are still in place, but are currently being re-considered by the

NEFMC as part of an overall evaluation of all area management measures in the region that are designed to protect EFH from fishing. Proposed changes will be analyzed in Omnibus EFH Amendment 2 and are expected to go into effect in 2015. Given the fact that the alternatives in this document would not adversely affect EFH (see Section 7.0), and that the habitat closures currently in place in New England include prohibitions on clam dredges, no alternatives to minimize adverse effects on EFH are presented in this document.

6.3 ESA-Listed Species and MMPA Protected Species

6.3.1 Species in the Fisheries Environment

There are numerous species inhabiting the environment, within the management unit of the two species managed through this FMP, that are afforded protection under the Endangered Species Act (ESA) of 1973 (i.e., for those designated as threatened or endangered) and the Marine Mammal Protection Act of 1972 (MMPA). Table 3 provides species formally listed as threatened or endangered under the ESA, that occur within the management units for surfclams and ocean quahogs.

More detailed description of the species listed in Table 3, including their environment, ecological relationships and life history information including recent stock status, is available at: <http://www.greateratlantic.fisheries.noaa.gov/Protected/>.

6.3.2 Commercial Fisheries Interactions

A description of the areas fished commercially for surfclams and ocean quahogs (i.e., area affected by the proposed action) is given in section 6.4.2. The commercial fisheries for surfclam and ocean quahogs are prosecuted with clam dredges, a type of bottom tending mobile gear. The List of Fisheries (LOF) classifies U.S. commercial fisheries into Categories according to the level of interactions that result in incidental mortality or serious injury of marine mammals (Table 4).

6.3.3 Description of Species with Interactions

There are no documented interactions with ESA-listed and MMPA protected species with clam dredges in the surfclam and ocean quahog fisheries. Detailed descriptions of other ESA-listed and MMPA protected species that are distributed within the management units of surfclam and ocean quahog are available at the following website: <http://www.nmfs.noaa.gov/pr/>. This site also contains general information on marine mammals (cetaceans and pinnipeds), marine turtles, marine and anadromous fish, and marine invertebrates and plants.

Table 3. Species endangered and threatened under the ESA that are found in the environment utilized by the Atlantic surfclam and ocean quahog fisheries.

Species	Common name	Scientific Name	Status
Cetaceans	North Atlantic right	<i>Eubalaena glacialis</i>	Endangered
	Humpback	<i>Megaptera novaeangliae</i>	Endangered
	Fin	<i>Balaenoptera physalus</i>	Endangered
	Blue	<i>Balaenoptera musculus</i>	Endangered
	Sei	<i>Balaenoptera borealis</i>	Endangered
	Sperm	<i>Physeter macrocephalus</i>	Endangered
Sea Turtles	Leatherback	<i>Dermochelys coriacea</i>	Endangered
	Kemp's ridley	<i>Lepidochelys kempii</i>	Endangered
	Green	<i>Chelonia mydas</i>	Threatened
	Hawksbill	<i>Eretmochelys imbricata</i>	Endangered
	Loggerhead ¹²	<i>Caretta caretta</i>	Threatened
Fishes	Shortnose sturgeon	<i>Acipenser brevirostrum</i>	Endangered
	Atlantic salmon	<i>Salmo salar</i>	Endangered
	Atlantic sturgeon	<i>Acipenser oxyrinchus</i>	Threatened - Gulf of Maine DPS
			Endangered - New York Bight DPS
			Endangered - Chesapeake Bay DPS
			Endangered - Carolina DPS
		Endangered - South Atlantic DPS

6.4 Human Communities and Economic Environment

A detailed description of the social and economic aspects of the fisheries for surfclam and ocean quahogs was presented in Amendment 13 to the FMP (MAFMC 2003). When Amendment 13 to the FMP was developed, the Council hired Dr. Bonnie McCay and her associates at Rutgers University to describe the ports and communities that are associated with the surfclam and ocean quahog fisheries (McCay and Cieri 2000). The researchers did an extensive job characterizing the three main fisheries (non-Maine ocean quahog, Maine ocean quahog, and surfclam). In addition, Fishery Performance Reports prepared by industry advisors, provide additional information on the social and economic environments and are available at <http://www.mafmc.org>. Recent trends in the fisheries are presented below.

6.4.1 Fishery Descriptions

6.4.1.1 Atlantic Surfclams

The total number of vessels participating in the surfclam fishery has been relatively stable from 2003 through 2013, ranging from 29 vessels in 2006 to 49 vessels in 2013 (Table 3). The average ex-vessel price of surfclams reported by processors increased about 2% from \$12.44 in 2012 to \$12.63 per bushel in 2013. The total ex-vessel value of the 2013 federal harvest was approximately \$31.0 million or 7% increase from the prior year.

As indicated above, surfclams on Georges Bank were not fished from 1990 to 2008 due to the risk of PSP. There was light fishing on Georges Bank in years 2009-2011 under an exempted fishing permit and LPUE in that area was substantially higher (5-7 times higher) than in other traditional fishing grounds. NOAA Fisheries reopened a portion of Georges Bank to the harvest of surfclams and ocean quahogs beginning January 1, 2013 (77 FR 75057, December 19, 2012) under its authority in 50 CFR 648.76. Subsequently, NOAA Fisheries reopened an additional portion of Georges Bank beginning August 16, 2013 (78 FR 49967). Harvesting vessels have to adhere to the recently adopted testing protocol developed by the National Shellfish Sanitation Program. It is anticipated that allowing clam vessels to fish in the reopened area would significantly reduce the fishing pressure in the southern portion of the surfclam range while providing an economic benefit to the industry because of the higher LPUE on Georges Bank.

6.4.1.2 Ocean Quahogs

The average ex-vessel price of non-Maine ocean quahogs reported by processors in 2013 was \$6.87 per bushel, representing no change from the 2012 price (\$6.88 per bushel). In 2013, 3.2 million bushels of non-Maine ocean quahog were landed compared to 3.4 million bushels (Table 2) landed in 2012. The total ex-vessel value of the 2013 federal harvest outside of Maine was approximately \$22.9 million, a 10% increase from the prior year.

The Maine ocean quahog fleet is allocated an overall quota in bushels. In 2013, the Maine ocean quahog fleet harvested a total of 60,302 Maine bushels, a 15% decrease from the 70,655 bushels harvested in 2012. In past years, the Maine ocean quahog fleet has leased

small amounts of ocean quahog ITQ from the non-Maine fishery, averaging 5,101 bushels for the 2009-2013 period (ranging from low values of zero bushels in 2013 and 137 bushels in 2012 to a high of 13,224 bushels in 2011). Therefore, small amounts of ITQ quota may be landed by the Maine ocean quahog fleet. Average prices for Maine ocean quahogs have declined substantially over the past 10 years. In 2003, there were very few trips that sold for less than \$37.00 per Maine bushel, and the mean price was \$40.66. Aggressive price cutting by one company has driven prices down such that many trips in 2008 and 2009 sold for \$28.00, with the mean price for all trips equaling \$33.31 per bushel in 2008. In 2013, the mean price was \$24.60 per Maine bushel. The value of the 2013 harvest reported by the purchasing dealers totaled \$1.48 million, a decrease of 15% from the prior year.

6.4.2 Description of the Areas Fished

A detailed description of the areas fished by the fisheries for surfclam and ocean quahogs was presented in Amendment 13 to the FMP (MAFMC 2003).

The commercial fishery for surfclams in Federal waters is prosecuted with large vessels and hydraulic dredges. The distribution of the fishery is shown in Figure 1. The commercial fishery for ocean quahogs in Federal waters is prosecuted with large vessels and hydraulic dredges, and is very different from the small Maine fishery prosecuted with small vessels (35-45 ft). The distribution of the fishery is shown in Figure 2.

6.4.3 Port and Community Description

Communities from Maine to Virginia are involved in the harvesting and processing of surfclams and ocean quahogs. Ports in New Jersey and Massachusetts handle the most volume and value, particularly Atlantic City and Point Pleasant, New Jersey, and New Bedford, Massachusetts. There are also landings in Ocean City, Maryland, and the Jonesport and Beals Island areas of Maine. The Maine fishery is entirely for ocean quahogs, which are sold as shellstock for the half-shell market. The other fisheries are industrialized ones for surfclams and ocean quahogs, which are hand shucked or steam-shucked and processed into fried, canned, and frozen products.

Additional information on "Community Profiles for the Northeast US Fisheries" can be found at: <http://www.nefsc.noaa.gov/read/socialsci/communityProfiles.html>.

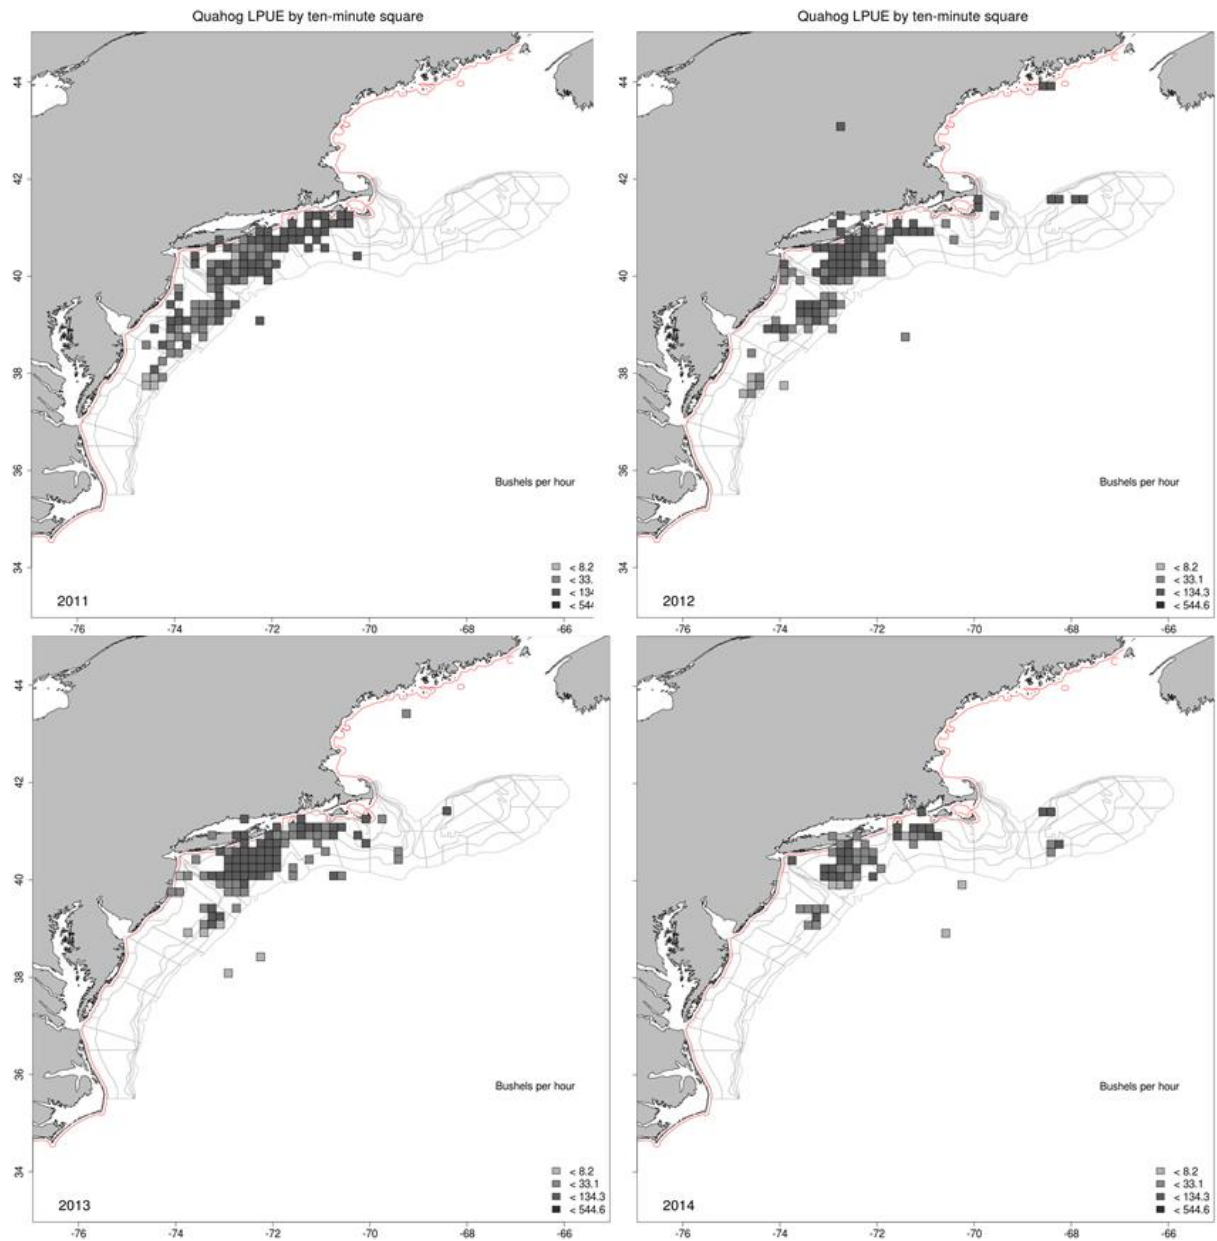

Figure 2. Ocean quahog landings per unit effort (bushels per hour) by ten-minute square (TMSQ), the finest scale location for landings reported in logbooks, for 2011-2013, and preliminary 2014 (1 kilo bushel = 1000 bu y-1). Source: Dan Hennen Pers. Comm. (NEFSC 2014).

6.4.4 Vessels and Dealers

Vessels

The total number of vessels participating in the surfclam fishery has been relatively stable from 2004 through 2013, ranging from 29 vessels in 2006 to 33 vessels in 2013 harvesting surfclams only¹³ (Table 5). The total number of vessels participating in the ocean quahog fisheries outside the state of Maine has experienced a downward trend as the fisheries moved beyond a market crisis in 2005 where major users of clam meats reduced their purchases from industry and stopped advertising products like clam chowder in the media. Industry members reported that imported meat from Canada and Vietnam contributed to an oversupply of clam meats in the marketplace. The costs to vessels harvesting clams have increased significantly, with the greatest component being the cost of diesel fuel. Trips harvesting quahogs have also increased in length as catch rates have declined steadily. The 30 or so vessels that reported landings during 2004 and 2005 was reduced and coast-wide harvests consolidated on to approximately 20 vessels in the subsequent years. The Maine ocean quahog fleet numbers started to decline with fuel prices soaring in mid-2008 and totaled 11 in 2013. (Table 5).

Table 5. Surfclam and Ocean Quahog active vessels composition by species harvested, 2004 -2013.

Vessel-type	Harvested Species	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Non-Maine Vessels	Both surfclams & quahogs	14	12	9	9	8	8	12	12	13	7
	Only surfclams	21	24	20	24	24	28	22	24	29	33
	Only quahogs	15	12	9	8	10	7	9	7	6	9
	Total	50	48	38	41	42	43	43	43	48	49
Maine Vessels	Only quahogs	34	32	25	24	22	19	15	13	12	11

Dealers

In 2013, there were 7 companies reporting purchases of surfclams and/or ocean quahogs from the industrial fisheries outside of Maine. They were distributed by state as indicated in Table 6. Employment data for these specific firms are not available. In 2013, these companies bought approximately \$21.9 million worth of ocean quahogs and \$31.0 million worth of surfclams.

¹³ The reported number of vessels participating in the surfclam and/or ocean quahog fisheries in this document are derived from Clam logbook data unless otherwise noticed.

Table 6. Companies that reported buying ocean quahogs and surfclams by state (from NOAA Fisheries dealer/processor report database) in 2013.

Number of Companies	MA	NJ	DE
3	3	3	1

7.0 ENVIRONMENTAL CONSEQUENCES OF ALTERNATIVES

This EA analyzes the impacts of the alternatives described fully under section 5.0. In summary, this includes:

Cost Recovery Alternatives (section 5.1)

- Alternative 1 (No action - No Cost Recovery)
- Alternative 2 (ITQ tag holder pays via a federally permitted dealer)
- Alternative 3 (ITQ shareholder and tag holder pays; two-tiered approach)
- Alternative 4 (Shareholder pays directly; equal fee per share)
- Alternative 5 (Shareholder pays; tilefish model)

Administrative Mechanism to Update Biological Reference Points Alternatives (section 5.2)

- Alternative 1 (No Action)
- Alternative 2 (Redefine the Status Determination Criteria)

Optimum Yield Range Alternatives (section 5.3)

- Alternative 1 (No Action)
- Alternative 2 (Remove OY Range from FMP; Advisors Recommend)
- Alternative 3 (Link Upper Bound OY Range to ABC Recommendations)

The aspects of the environment (Valued Ecosystem Components - VECs) that could be affected by the proposed actions are detailed in section 6.0, and the analysis in this section focuses on impacts relative to those (managed resources and non-target species, habitat (including EFH), ESA listed and MMPA protected resources, and human communities). Other aspects of the human environment, such as historic and cultural resources, noise, invasive species, and others, have no potential to be impacted by any of the alternatives and are not analyzed further in this document. For each suite of alternatives, a no action (*status quo*) alternative is presented as alternative 1.

7.1 Biological Impacts

7.1.1 Cost Recovery Alternatives

Under alternative 1, a cost recovery program would not be implemented. Alternative 1 (No action) is expected to result in neutral biological impacts on the Atlantic surfclam or ocean quahog stock, and any non-target species or bycatch. This alternative would be in violation of provisions of the MSA, as the Act requires that a process be established to recover the costs directly related to management, data collection and analysis, and enforcement of ITQ programs.

Alternatives 2-5 are purely administrative as they deal with the recovery of the costs for the management, data collection and analysis, and enforcement of the IFQ program. As a result, impacts resulting from this alternative are not likely to affect the physical or biological environment. Therefore, the alternatives are not expected to have any impact on fishing methods and practices or the interaction of this fishery with non-targeted species. Therefore, biological impacts from all the alternatives (1-5) are expected to be similar.

7.1.2 Administrative Mechanism to Update BRPs Alternatives

Alternative 1 (No action) is expected to result in neutral to slight negative biological impacts on the Atlantic surfclam and ocean quahog stocks, and any non-target species or bycatch. This no action alternative would not allow for updates to biological reference points in the FMP when warranted (would require an Amendment), and as such, may have slight negative impacts relative to alternative 2. Relative to the no action alternative 1, alternative 2 is expected to result in neutral to slight positive biological impacts on Atlantic surfclam or ocean quahog stock, or any non-target species or bycatch. Alternative 2 merely revises the current definitions of the stock status determination criteria for each species and defines the process by which updates to status determination criteria are integrated into the management process. This action is purely administrative; however, there may be indirect slight positive effects from managing these stocks with more accurate or reliable information on stock status that is incorporated into the FMP in a timely way. This action does not directly influence fishing effort, or fishery removals but instead facilitates use of the most current scientific information available to define the status determination criteria for these stocks, so these stocks can be managed to prevent overfishing and manage such that the Atlantic surfclam and ocean quahog stocks are not overfished. By allowing peer-reviewed scientific updates on status determination criteria to be incorporated into the FMP and management process more efficiently (not requiring a timely amendment process), managers can more effectively respond to changes in stock status and make timely adjustments to the management programs for the Atlantic surfclam and ocean quahog stocks. This improvement in efficiency will aid in managing these stocks for sustainability.

7.1.3 Optimum Yield Range Alternatives

All of these alternatives including the No action alternative are expected to result in neutral biological impacts on the Atlantic surfclam and ocean quahog stocks, and any non-target species or bycatch, because these measures are administrative in nature. Regardless of whether the surfclam and ocean quahog OY ranges are or are not retained in the FMP, the proposed action does not alter the specification process by which the Council specifies catch and landings limits that prevent overfishing and are consistent with the advice of its SSC. The Council examines the best available science, consults with its advisors, and undergoes a deliberative process to decide on what upcoming fishing year measures should be recommended. The impacts of those actions are evaluated through a specification EA. Specifically, the Council's catch limits cannot exceed the ABC recommendations of the SSC.

The current regulations indicate that commercial quotas for surfclams and ocean quahogs must be set within the OY ranges given in the FMP. However, the regulations also state that quotas for surfclams and ocean quahogs may be specified below these ranges if the ABC recommendation of the SSC limits the ACL to a value less than the minimum of the OY range indicated. This flexibility only applies to the lower bound of the OY ranges, and there is no such flexibility in the upper bound of the OY ranges. If the Council wanted to set a commercial quota higher than the upper bound of the OY range for surfclams or ocean quahogs, the OY range would need to be modified through a framework. Frameworks typically take a minimum of 1-year to be completed; with a minimum of two framework

meetings and approximately 4-6 months for rulemaking and implementation. Therefore, both alternative 2 and alternative 3 are intended to bring consistency in how the Council sets commercial quotas relative to the ABC, and consistent treatment of quotas either above or below the currently specified OY range. Lastly, in the NS1 guidelines at §600.310, under the response to comments, NOAA Fisheries states, "NMFS believes that fisheries managers cannot consistently meet the requirements of the MSA to prevent overfishing and achieve, on a continuing basis, OY [optimum yield] unless they address scientific and management uncertainty. The reduction in fishing levels that may be necessary in order to prevent overfishing should be only the amount necessary to achieve the results mandated by the MSA". This suggests that setting commercial quotas less than the OY range in the plan is not consistent with this guidance or the way NMFS interprets OY and sets up a conceptual disconnect between OY and the system of catch and landings limits which address scientific and management uncertainty.

By eliminating the OY range under alternative 2 and having advisors recommend an OY as part of the specifications process, managers can more effectively respond to changes in surfclam and ocean quahog stock status and make timely adjustments to the management programs for the Atlantic surfclam and ocean quahog stocks regardless of the direction of the ABC recommendations of the SSC.

Under alternative 3, the upper bound of the OY range for both surfclams and ocean quahog would be equal to the ABC recommended by the SSC. This would reduce the potential for disconnect with the existing OY ranges. However, there is the potential that the ABC could be set lower than the lower bound of the OY ranges for surfclams and ocean quahogs. This could create some administrative confusion because the Council's Omnibus ACL and AM Amendment indicated that OY should be somewhere between ABC and the annual catch target (ACT) once scientific and management uncertainty have been addressed.

7.2 Habitat Impacts

7.2.1 Cost Recovery Alternatives

Alternative 1 (No action) is expected to result in neutral impacts on habitat. In addition, the actions considered under alternatives 2-5 are purely administrative. These alternatives are not expected to have any impact on fishing methods and practices and are not expected to result in changes in fishing effort or redistribution in fishing effort. Therefore, none of the alternatives under consideration are expected to have adverse impacts to the marine habitats or EFH.

7.2.2 Administrative Mechanism to Update BRPs Alternatives

Alternative 1 (No action) is expected to result in neutral impacts on habitat. Relative to the no action alternative 1, alternative 2 is expected to result in neutral impacts on habitat. This action merely revises the current definitions of the stock status determination criteria for each species and defines the process by which updates to status determination criteria are integrated into the management process. The proposed action is purely administrative;

therefore, it is not expected to result in changes to the manner in which the Atlantic surfclam and ocean quahog fisheries are prosecuted.

7.2.3 Optimum Yield Range Alternatives

Alternative 1 (No action) is expected to result in neutral impacts on habitat. Relative to the no action alternative 1, alternatives 2 and 3 are expected to result in neutral impacts on habitat. Alternative 2 merely eliminates the OY range in the FMP and has advisors recommend OY as part of the specification process. Under alternative 3 the upper bound of the OY range for both surfclams and ocean quahogs would be equal to the ABC recommended by the SSC. Regardless of whether the surfclam and ocean quahog OY ranges are or are not retained in the FMP, the proposed action does not alter the specification process by which the Council specifies catch and landings limits that prevent overfishing and are consistent with the advice of its SSC. The Council examines the best available science, consults with its advisors, and undergoes a deliberative process to decide on what upcoming fishing year measures should be recommended. The impacts of those actions are evaluated through a specification EA. The proposed action under alternatives 2 and 3 is purely administrative (the more detailed discussion in 7.1.3 applies here); therefore, it is not expected to result in changes to the manner in which the Atlantic surfclam and ocean quahog fisheries are prosecuted.

7.3 Impacts on ESA-Listed Species and MMPA Protected Species

7.3.1 Cost Recovery Alternatives

Alternative 1 (No action) is expected to result in neutral impacts on ESA-listed and MMPA protected resources. In addition, the actions considered under alternatives 2-5 are purely administrative. These alternatives are not expected to have any impact on fishing methods and practices and are not expected to result in changes in fishing effort or redistribution in fishing effort. Therefore, none of the alternatives under consideration are expected to have adverse impacts on ESA-listed and MMPA protected resources.

7.3.2 Administrative Mechanism to Update BRPs Alternatives

Alternative 1 (No action) is expected to result in neutral impacts on ESA-listed and MMPA protected resources. Relative to the no action alternative 1, alternative 2 is expected to result in neutral impacts on these resources. This action merely revises the current definitions of the stock status determination criteria for each species and defines the process by which updates to status determination criteria are integrated into the management process. The proposed action is purely administrative; therefore, it is not expected to result in changes to the manner in which Atlantic surfclam and ocean quahog fisheries are prosecuted.

7.3.3 Optimum Yield Range Alternatives

Alternative 1 (No action) is expected to result in neutral impacts on ESA-listed and MMPA protected resources. Relative to the no action alternative 1, alternatives 2 and 3 are expected

to result in neutral impacts on habitat. Alternative 2 merely eliminates the OY range in the FMP and has advisors recommend OY as part of the specification process. Under alternative 3 the upper bound of the OY range for both surfclams and ocean quahog would be equal to the ABC recommended by the SSC. Regardless of whether the surfclam and ocean quahog OY ranges are or are not retained in the FMP, the proposed action does not alter the specification process by which the Council specifies catch and landings limits that prevent overfishing and are consistent with the advice of its SSC. The Council examines the best available science, consults with its advisors, and undergoes a deliberative process to decide on what upcoming fishing year measures should be recommended. The impacts of those actions are evaluated through a specification EA. The proposed action under alternatives 2 and 3 is purely administrative (the more detailed discussion in 7.1.3 applies here); therefore, it is not expected to result in changes to the manner in which the Atlantic surfclam and ocean quahog fisheries are prosecuted.

7.4 Socioeconomic Impacts

7.4.1 Cost Recovery Alternatives

Under the No action alternative 1, a fee and costs recovery program would not be implemented; therefore, socioeconomic impacts would be neutral when compared to the current conditions.

Alternative 2-5 could collect up to a 3 percent maximum of the ex-vessel value of surfclam and ocean quahog harvested under the ITQ program. However, initial conversations with GARFO staff indicated that a conservative initial estimate of management, enforcement, and data collection cost could be approximately \$100,000 (the equivalent of a 0.2 percent fee, based on the ex-vessel value of the fishery in 2013), thus for the purpose of discussing a range of potential impacts, a 0.2 percent fee is compared to the potential maximum 3 percent fee, and the no action fee of 0 percent. Surfclam and ocean quahog landings have been relatively stable during the last 3 years (2011-2013; Table 2). Unless market conditions change substantially in the near future, it would be expected that commercial fishermen would likely have landings for these shellfish resources close to the average landings for the 2011-2013 landings. Based on average landings and ex-vessel prices for the 2011-2013 period of 2.4 million bushels and \$12.32 per bushel for surfclams, and 3.3 million bushels and \$6.90 per bushel for ocean quahogs, and the maximum fee level of 3 percent; the total fee expected to be collected in the first year of the program would be \$1.57 million under the maximum fee level allowed to be collected under MSA (Table 7). It is important to mention that while alternatives 2-5 could impose a cost recovery rate of up to 3 percent, this rate is likely to be substantially lower given the amounts current collected in other Northeast ITQ fisheries, and may change in subsequent years. For example, Table 7 shows the potential fees under a 3 and a 0.2 percent fee.

For both alternatives 2 and 5, the cost recovery fee is based on landings (tags that are fished), however, under alternative 2 the tag holder pays via a federally permit dealer and under alternative 5 the shareholder pays directly to NOAA Fisheries. Under both of these alternatives, assuming average surfclam and ocean quahog landings and ex-vessel prices

for the 2011-2013 period, the potential cost to fishermen associated with a cost recovery fee of 3 percent of ex-vessel value could on average range from approximately \$22,176 for vessels that landed surfclams to \$42,694 for vessels that landed ocean quahogs. The potential cost to fishermen associated with the cost recovery fee of up to 0.2 percent could range on average from approximately \$1,478 for vessels that landed surfclams to \$2,846 for vessels that landed ocean quahogs (Table 8). For vessels that land both species, the average cost recovery fee will likely vary from these estimates and would depend on the proportion of each species landed. The potential overall cost to business firms associated with a cost recovery fee under alternatives 2 and 5 would depend on the percentage recovery fee implemented for a specific fishing year and the amount of landings by the specific firm which may use one or multiple vessels.

Note that individual allocations are often registered in the name of a corporation, rather than an individual. It is common for owners of multiple fishing vessels to list each one as being owned by a separate corporation for the purpose of limiting liability. Similarly, a single individual might own multiple allocations that are listed in NOAA Fisheries records as being registered to distinct corporations for the same reason. Banks that have loaned money to allocation holders will often require that the allocation be placed in the bank's name as collateral for the loan. A single individual may have several such loans. As such, it is important to understand that the number of allocations is not equal to the number of allocation owners. Therefore, number of owners will be smaller due to the ownership of multiple allocations. Allocation ownership is a matter of public record. A complete list of the current allocation owners of record may be found and in Appendix B and at: <http://www.nero.noaa.gov/sustainable/species/clam/>. These are the entities that will be most directly impacted. However, NOAA Fisheries does not currently have information to characterize entities at the owner level. Instead, information on fishing activities is used to characterize and enumerate entities. Additional analysis associated with the cost recovery program at the firm level¹⁴ will be presented as part of the initial regulatory flexibility analysis (IRFA).

Under alternative 4, using the same 2011-2013 assumptions about landings and ex-vessel prices for these species presented above, the potential per tag cost associated with the cost recovery fee of 3 percent could range on average from approximately \$4.10 per ocean quahog tag to \$8.36 per surfclam tag to (Table 8). The potential cost to associate with the cost recovery fee of up to 0.2 percent could range on average from \$0.27 per ocean quahog tag to \$0.56 per surfclam tag. Table 9 shows the potential shareholder cost recovery fees (maximum, minimum, average) under a 3 and 0.2 percent fee given the surfclam and ocean quahog tags allocated in 2014.

It is expected that under the two-tier approach in alternative 3, the portion of the cost recovery fee assessed proportionate to shareholder would be substantially smaller than the portion of the cost recovery fee to be paid when the tags are used to land. This is due to the fact that the administrative cost of managing allocation and issuing tags is lower than the

¹⁴ In some cases, some of the vessels with surfclam and ocean quahog permits may be considered to be part of the same firm because they may have the same owners listed. However, the same issues with identifying ownership (described above) will still apply to this allocation holder dataset.

overall costs directly related to management, data collection and analysis, and enforcement of this ITQ program. The potential overall cost to business firms associated with a cost recovery fee under alternatives 3 and 4 would depend on the percentage fee implemented for a specific fishing year and the overall number of shares or tags received and/or used to land by the specific firm.

The overall net cost per ITQ shareholder, vessel, or tag holder associated with surfclam and ocean quahog cost recovery would depend on the cost recovery fee implemented which cannot exceed 3 percent of the ex-vessel value, the amount and value of surfclam and ocean quahog landed, and any other potential costs associated with paying the fee (e.g., time to compile information and complete paperwork associated with payment of fees). In addition, there would likely be a small cost in time to dealers associated with tracking payment of fees associated with any ITQ landings.

Alternatives 2 and 5 are expected to have negative socioeconomic impacts compared to alternative 1 as fishermen revenues could potentially decrease by up to 3 percent of ex-vessel value due to fees collected by NOAA Fisheries. The extent of negative impacts is slightly different for each of the alternatives. Alternative 4 is expected to incur the smallest negative impacts to individuals that land surfclams and ocean quahogs because the fees to be recovered are spread across all shareholders. Alternative 4 would have the greatest negative impacts to shareholders holders that do not land shellfish. This is because the fee would be shared by all shareholders regardless of whether the ITQ was fished or not. In terms of impacts, this would be followed by alternative 3 (two-tiered approach) because all tag holders would have a percentage of the fee assessed proportionate to the amount of allocation (shares) held by the shareholder. The initial portion of the fee would be paid by all shareholders regardless of whether their ITQ was fished or not. Therefore, a portion of the fee is spread across all shareholders similar to alternative 4. Alternatives 2 and 5 would have the greatest negative impacts to individuals that land surfclams and ocean quahogs because the fee is only borne by the ITQ quota (tags) that have been fished; therefore, the universe of quota shares to which the fee is applied is smaller. Alternatives 2-5 would have no impacts on shareholders that did not land with their surfclam and ocean quahog ITQ.

Alternatives 2-5 would impose a cost recovery fee of up to 3 percent of ex-vessel value of surfclam and ocean quahog harvested under the ITQ program. However, the actual rate is likely to be substantially lower given the amounts currently collected in other Northeast ITQ fisheries, and may change in subsequent years. Each year, NOAA Fisheries will determine the percentage of the ex-vessel value of surfclam and ocean quahog that would be collected. It is possible that neutral societal costs impacts will occur as management costs associated with fishing this public resource are simply shifted from the general public/tax payer to the fishing industry as required under MSA.

Table 7. Potential fees associated with a 0.2 and a 3 percent fee under the surfclam and ocean quahog ITQ system assuming 2013 landings and ex-vessel values.

a. Potential fees associated with a 0.2 percent fee recovery program.

	Average Landings 2011-2013	Average ex-vessel value based on an ex-vessel price of \$12.32/bu for surfclam and \$6.90/bu for ocean quahogs (2011-2013)	Cost associated with a 0.2 percent fee recovery program
Surfclam	2.4 million bu	\$29.568 million	\$59,136
Ocean Quahog	3.3 million bu	\$22.770 million	\$45,540
Total	5.7 million bu	\$52.338 million	\$104,676

Table 8. Potential fees at the vessel and tag level associated with a 0.2 and a 3 percent fee under the surfclam and ocean quahog ITQ system assuming 2013 landings and ex-vessel values.

a. Potential fees associated with a 0.2 percent fee recovery program.

	Cost associated with a 0.2 percent fee recovery program	Number of vessels that landed surfclam and ocean quahogs in 2013	Per vessel average cost associated with a 0.2 percent fee recovery program
Surfclam	\$59,136	40	\$1,478
Ocean quahog	\$45,540	16	\$2,846
	Cost associated with a 0.2 percent fee recovery program	Number of cages tags issued in 2014*	Per tag average cost associated with a 0.2 percent fee recovery program
Surfclam	\$59,136	106,132	\$0.56
Ocean quahog	\$45,540	166,415	\$0.27

b. Potential fees associated with a 3 percent fee recovery program.

	Cost associated with a 3 percent fee recovery program	Number of vessels that landed surfclam and ocean quahogs in 2013	Per vessel average cost associated with a 3 percent fee recovery program
Surfclam	\$887,040	40	\$22,176
Ocean quahog	\$683,100	16	\$42,694
	Cost associated with a 3 percent fee recovery program	Number of cages tags issued in 2014*	Per average tag cost associated with a 3 percent fee recovery program
Surfclam	\$887,040	106,132	\$8.36
Ocean quahog	\$683,100	166,415	\$4.10

*See Appendix B for the surfclam and ocean quahog allocation holder report for 2014.

Table 9. Potential fees associated with a 0.2 and a 3 percent fee under the surfclam and ocean quahog ITQ system assuming the number of cage tags issued in 2014.

a. Potential fees associated with a 0.2 percent fee recovery program.

		Number of cages tags issued in 2014	Per tag average cost associated with a 0.2 percent fee recovery program	Cost associated with a 0.2 percent fee recovery program
Surfclam	Maximum	14,177	\$0.56	\$7,939
	Minimum	52	\$0.56	\$29
	Average	1,516	\$0.56	\$849
Ocean Quahog	Maximum	36,314	\$0.27	\$9,805
	Minimum	2	\$0.27	\$0.54
	Average	4,059	\$0.27	\$1,096

a. Potential fees associated with a 3 percent fee recovery program.

		Number of cages tags issued in 2014	Per tag average cost associated with a 3 percent fee recovery program	Cost associated with a 3 percent fee recovery program
Surfclam	Maximum	14,177	\$8.36	\$118,520
	Minimum	52	\$8.36	\$435
	Average	1,516	\$8.36	\$12,674
Ocean Quahog	Maximum	36,314	\$4.10	\$148,887
	Minimum	2	\$4.10	\$8
	Average	4,059	\$4.10	\$16,642

7.4.2 Administrative Mechanism to Update BRPs Alternatives

Alternative 1 (No action) is expected to result in neutral impacts on the social and economic environment. Relative to the no action alternative 1, alternative 2 is expected to result in neutral impacts on the social and economic environment. This action merely revises the current definitions of the stock status determination criteria for each species and defines the process by which updates to status determination criteria are integrated into the FMP and management process. The proposed action is purely administrative; therefore, it does not alter the catch and landings limits for these species or the allocation of the resources among user groups, with no direct impact on fishing effort or effort distribution in the Atlantic surfclam and ocean quahog fisheries.

7.4.3 Optimum Yield Range Alternatives

Alternative 1 (No action) is expected to result in neutral impacts on the social and economic environment. Relative to the no action alternative 1, alternatives 2 and 3 are expected to result in neutral impacts on the social and economic environment. Alternative 2 merely eliminates the OY range in the FMP and has advisors recommend OY as part of the specification process. Under alternative 3 the upper bound of the OY range for both surfclams and ocean quahog would be equal to the ABC recommended by the SSC. Regardless of whether the surfclam and ocean quahog OY ranges are or are not retained in the FMP, the proposed action does not alter the specification process by which the Council specifies catch and landings limits that prevent overfishing and are consistent with the advice of its SSC. The Council examines the best available science, consults with its advisors, and undergoes a deliberative process to decide on what upcoming fishing year measures should be recommended. The impacts of those actions are evaluated through a specification EA. The proposed action under alternatives 2 and 3 is purely administrative (the more detailed discussion in 7.1.3 applies here); therefore, it is not expected to result in changes to the manner in which the Atlantic surfclam and ocean quahog fisheries are prosecuted or impact those individuals and communities that are dependent on the fisheries. The measures proposed under alternatives 2 and 3 merely provide for consistency and administrative efficiency.

7.5 Cumulative Effects Analysis

A cumulative effects analysis (CEA) is required by the Council on Environmental Quality (CEQ) (40 CFR part 1508.7). The purpose of CEA is to consider the combined effects of many actions on the human environment over time that would be missed if each action were evaluated separately. CEQ guidelines recognize that it is not practical to analyze the cumulative effects of an action from every conceivable perspective, but rather, the intent is to focus on those effects that are truly meaningful. A formal cumulative impact assessment is not necessarily required as part of an EA under NEPA as long as the significance of cumulative impacts have been considered (U.S. EPA 1999). The following remarks address the significance of the expected cumulative impacts as they relate to the federally managed Atlantic surfclam and ocean quahog fisheries.

7.5.1 Consideration of the VECs

In section 6.0 (Description of the Affected Environment), the VECs that exist within surfclam and ocean quahog fishery environment are identified. Therefore, the significance of the cumulative effects will be discussed in relation to the VECs listed below.

1. Managed resources (surfclams and ocean quahogs)
2. Non-target species
3. Habitat including EFH for the managed resource and non-target species
4. ESA-listed and MMPA protected species
5. Human communities

7.5.2 Geographic Boundaries

The analysis of impacts focuses on actions related to the harvest of Atlantic surfclams and ocean quahogs. The core geographic scope for each of the VECs is focused on the Western Atlantic Ocean (section 6.0). The core geographic scopes for the managed resources are the range of the management units (section 6.1). For non-target species, those ranges may be expanded and would depend on the biological range of each individual non-target species in the Western Atlantic Ocean. For habitat, the core geographic scope is focused on EFH within the EEZ but includes all habitat utilized by surfclam and ocean quahog and other non-target species in the Western Atlantic Ocean. The core geographic scope for endangered and protected resources can be considered the overall range of these VECs in the Western Atlantic Ocean. For human communities, the core geographic boundaries are defined as those U.S. fishing communities directly involved in the harvest or processing of the managed resources, which were found to occur in coastal states from Maine through Virginia (section 6.4).

7.5.3 Temporal Boundaries

The temporal scope of past and present actions for VECs is primarily focused on actions that have occurred after FMP implementation (1977 for surfclams and ocean quahogs). For endangered and other protected resources, the scope of past and present actions is on a species-by-species basis (section 6.3) and is largely focused on the 1980s and 1990s through the present, when NOAA Fisheries began generating stock assessments for marine mammals and sea turtles that inhabit waters of the U.S. EEZ. The temporal scope of future actions for all five VECs extends about three years (2017) into the future. This period was chosen because the dynamic nature of resource management and lack of information on projects that may occur in the future make it very difficult to predict impacts beyond this timeframe with any certainty.

7.5.4 Actions Other Than Those Proposed in this Amendment

The impacts of each of the alternatives considered in this amendment document are given in section 7.1 through 7.4. Table 10 presents meaningful past (P), present (Pr), or reasonably foreseeable future (RFF) actions to be considered other than those actions being considered in this amendment document. These impacts are described in chronological order and qualitatively, as the actual impacts of these actions are too complex to be quantified in a meaningful way. When any of these abbreviations occur together (i.e., P, Pr, RFF), it indicates that some past actions are still relevant to the present and/or future actions.

Past and Present Actions

The historical management practices of the Council have resulted in positive impacts on the health of the surfclam and ocean quahog stocks (section 6.1). Numerous actions have been taken to manage these fisheries through amendment and framework adjustment actions. The specifications process provides the opportunity for the Council and NOAA Fisheries to regularly assess the status of the fishery and to make necessary adjustments to ensure that there is a reasonable expectation of meeting the objectives of the FMP. The statutory basis for federal fisheries management is the MSA. To the degree with which this regulatory regime and National Standards are complied, the cumulative impacts of past, present, and reasonably foreseeable future federal fishery management actions on the VECs should generally be associated with positive long-term outcomes, which should bring about long-term sustainability of a given resource, and as such, should, in the long-term, promote positive effects on human communities, especially those that are economically dependent upon the surfclam and ocean quahog stocks.

Non-fishing activities that introduce chemical pollutants, sewage, changes in water temperature, salinity, dissolved oxygen, and suspended sediment into the marine environment pose a risk to all of the identified VECs. Human-induced non-fishing activities tend to be localized in nearshore areas and marine project areas where they occur. Examples of these activities include, but are not limited to agriculture, port maintenance, beach nourishment, coastal development, marine transportation, marine mining, dredging and the disposal of dredged material. Wherever these activities co-occur, they are likely to work additively or synergistically to decrease habitat quality and, as such, may indirectly constrain the sustainability of the managed resources, non-target species, and protected resources. Decreased habitat suitability would tend to reduce the tolerance of these VECs to the impacts of fishing effort. Mitigation of this outcome through regulations that would reduce fishing effort could then negatively impact human communities. The overall impact to the affected species and their habitats on a population level is unknown, but likely neutral to low negative, since a large portion of these species have a limited or minor exposure to these local non-fishing perturbations.

In addition to guidelines mandated by the MSA, NOAA Fisheries reviews these types of effects through the review processes required by Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act for certain activities that are regulated by federal, state, and local authorities. The jurisdiction of these activities is in "waters of the U.S." and includes both riverine and marine habitats.

Reasonably Foreseeable Future Actions

The implementation of a data collection protocol process to collect information about quota share ownership for the surfclam and ocean quahog ITQ fisheries by NOAA Fisheries, as requested by the Council, is likely to occur within the next year (by 2015). An Amendment to address excessive share accumulation for these ITQ fisheries will be developed and could potentially begin in 2016. As a result, these Reasonably Foreseeable Future Actions over the next three years will address outstanding issue for the management of surfclams and ocean quahogs.

For many of the proposed non-fishing activities to be permitted under other federal agencies (such as beach nourishment, offshore wind facilities, etc.), those agencies would conduct examinations of potential impacts on the VECs. The MSA (50 CFR 600.930) imposes an obligation on other federal agencies to consult with the Secretary of Commerce on actions that may adversely affect EFH. The eight Fishery Management Councils are engaged in this review process by making comments and recommendations on any federal or state action that may affect habitat, including EFH, for their managed species and by commenting on actions likely to substantially affect habitat, including EFH.

In addition, under the Fish and Wildlife Coordination Act (Section 662), “whenever the waters of any stream or other body of water are proposed or authorized to be impounded, diverted, the channel deepened, or the stream or other body of water otherwise controlled or modified for any purpose whatever, including navigation and drainage, by any department or agency of the U.S., or by any public or private agency under federal permit or license, such department or agency first shall consult with the U.S. Fish and Wildlife Service (USFWS), Department of the Interior, and with the head of the agency exercising administration over the wildlife resources of the particular state wherein the” activity is taking place. This act provides another avenue for review of actions by other federal and state agencies that may impact resources that NOAA Fisheries manages in the reasonably foreseeable future.

In addition, NOAA Fisheries and the USFWS share responsibility for implementing the ESA. ESA requires NOAA Fisheries to designate "critical habitat" for any species it lists under the ESA (i.e., areas that contain physical or biological features essential to conservation, which may require special management considerations or protection) and to develop and implement recovery plans for threatened and endangered species. The ESA provides another avenue for NOAA Fisheries to review actions by other entities that may impact endangered and protected resources whose management units are under NOAA Fisheries jurisdiction.

7.5.5 Magnitude and Significance of Cumulative Effects

In determining the magnitude and significance of the cumulative effects, the additive and synergistic effects of the proposed action, as well as past, present, and future actions, must be taken into account. The following section discusses the effects of these actions on each of the VECs.

Table 10. Impacts of Past (P), Present (Pr), and Reasonably Foreseeable Future (RFF) Actions on the five VECs (not including those actions considered in this Amendment document).

Action	Description	Impacts on Managed Resource	Impacts on Non-target Species	Impacts on Habitat and EFH	Impacts on Protected Species	Impacts on Human Communities
P, Pr Original FMP and Amendments and Frameworks to the FMP	Established management measures	Indirect Positive Regulatory tool available to rebuild and manage stocks	Indirect Positive Reduced fishing effort	Indirect Positive Reduced fishing effort	Indirect Positive Reduced fishing effort	Indirect Positive Benefited domestic businesses
P, Pr Surfclam and Ocean Quahog Specifications	Establish quotas, other fishery regulations	Indirect Positive Regulatory tool to specify catch limits, and other regulation; allows response to annual stock updates	Indirect Positive Reduced effort levels and gear requirements	Indirect Positive Reduced effort levels and gear requirements	Indirect Positive Reduced effort levels and gear requirements	Indirect Positive Benefited domestic businesses
P, Pr, RFF Developed, Applied, and Redo of Standardized Bycatch Reporting Methodology	Established acceptable level of precision and accuracy for monitoring of bycatch in fisheries	Neutral May improve data quality for monitoring total removals of managed resource	Neutral May improve data quality for monitoring removals of non-target species	Neutral Will not affect distribution of effort	Neutral May increase observer coverage and will not affect distribution of effort	Potentially Indirect Negative May impose an inconvenience on vessel operations
P, Pr, RFF PSP Closed Areas	Reopening of PSP Closed Areas to Clam fishing	Neutral to Indirect Negative Fishery impacts in previously unfished areas	Indirect Positive Reduced overall fishing effort	Indirect Positive Reduced overall fishing effort	Neutral Limited interactions with gear occur	Indirect Positive Benefitted domestic businesses
P, Pr, RFF Agricultural runoff	Nutrients applied to agricultural land are introduced into aquatic systems	Indirect Negative Reduced habitat quality	Indirect Negative Reduced habitat quality	Direct Negative Reduced habitat quality	Indirect Negative Reduced habitat quality	Indirect Negative Reduced habitat quality negatively affects resource
P, Pr, RFF Port maintenance	Dredging of coastal, port and harbor areas for port maintenance	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Uncertain – Likely Direct Negative Dependent on mitigation effects	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Uncertain – Likely Mixed Dependent on mitigation effects

Table 10 (Continued). Impacts of Past (P), Present (Pr), and Reasonably Foreseeable Future (RFF) Actions on the five VECs (not including those actions considered in this Amendment document).

Action	Description	Impacts on Managed Resource	Impacts on Non-target Species	Impacts on Habitat and EFH	Impacts on Protected Species	Impacts on Human Communities
P, Pr, RFF Offshore disposal of dredged materials	Disposal of dredged materials	Indirect Negative Reduced habitat quality	Indirect Negative Reduced habitat quality	Direct Negative Reduced habitat quality	Indirect Negative Reduced habitat quality	Indirect Negative Reduced habitat quality negatively affects resource viability
P, Pr, RFF Beach nourishment	Offshore mining of sand for beaches	Indirect Negative Localized decreases in habitat quality	Indirect Negative Localized decreases in habitat quality	Direct Negative Reduced habitat quality	Indirect Negative Localized decreases in habitat quality	Mixed Positive for mining companies, possibly negative for fishing industry
	Placement of sand to nourish beach shorelines	Indirect Negative Localized decreases in habitat quality	Indirect Negative Localized decreases in habitat quality	Direct Negative Reduced habitat quality	Indirect Negative Localized decreases in habitat quality	Positive Beachgoers like sand; positive for tourism
P, Pr, RFF Marine transportation	Expansion of port facilities, vessel operations and recreational marinas	Indirect Negative Localized decreases in habitat quality	Indirect Negative Localized decreases in habitat quality	Direct Negative Reduced habitat quality	Indirect Negative Localized decreases in habitat quality	Mixed Positive for some interests, potential displacement for others
P, Pr, RFF Installation of pipelines, utility lines and cables	Transportation of oil, gas and energy through pipelines, utility lines and cables	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Uncertain – Likely Direct Negative Reduced habitat quality	Potentially Direct Negative Dependent on mitigation effects	Uncertain – Likely Mixed Dependent on mitigation effects
P, Pr, RFF National Offshore Aquaculture Act of 2007	Bill that grants DOC authority to issue permits for offshore aquaculture in federal waters	Potentially Indirect Negative Localized decreases in habitat quality possible	Potentially Indirect Negative Localized decreases in habitat quality possible	Direct Negative Localized decreases in habitat quality possible	Potentially Indirect Negative Localized decreases in habitat quality possible	Uncertain – Likely Mixed Costs/benefits remain unanalyzed

Table 10 (Continued). Impacts of Past (P), Present (Pr), and Reasonably Foreseeable Future (RFF) Actions on the five VECs (not including those actions considered in this Amendment document).

Action	Description	Impacts on Managed Resource	Impacts on Non-target Species	Impacts on Habitat and EFH	Impacts on Protected Species	Impacts on Human Communities
RFF Offshore Wind Energy Facilities (within 3 years)	Construction of wind turbines to harness electrical power (Several proposed from ME through NC, including NY/NJ, DE, and VA)	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Potentially Direct Negative Localized decreases in habitat quality possible	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Uncertain – Likely Mixed Dependent on mitigation effects
Pr, RFF Liquefied Natural Gas (LNG) terminals (within 3 years)	Transport natural gas via tanker to terminals offshore and onshore (1 terminal built in MA; 1 under construction; proposed in RI, NY, NJ and DE)	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Potentially Direct Negative Localized decreases in habitat quality possible	Uncertain – Likely Indirect Negative Dependent on mitigation effects	Uncertain – Likely Mixed Dependent on mitigation effects
RFF Convening of Gear Take Reduction Teams (within next 3 years)	Recommend measures to reduce mortality and injury to marine mammals	Indirect Positive Will improve data quality for monitoring total removals	Indirect Positive Reducing availability of gear could reduce bycatch	Indirect Positive Reducing availability of gear could reduce gear impacts	Indirect Positive Reducing availability of gear could reduce encounters	Indirect Negative Reducing availability of gear could reduce revenues
RFF Strategy for Sea Turtle Conservation for the Atlantic Ocean and the Gulf of Mexico Fisheries (w/in next 3 years)	May recommend strategies to prevent the bycatch of sea turtles in commercial fisheries operations	Indirect Positive Will improve data quality for monitoring total removals	Indirect Positive Reducing availability of gear could reduce bycatch	Indirect Positive Reducing availability of gear could reduce gear impacts	Indirect Positive Reducing availability of gear could reduce encounters	Indirect Negative Reducing availability of gear could reduce revenues

Table 10 (Continued). Impacts of Past (P), Present (Pr), and Reasonably Foreseeable Future (RFF) Actions on the five VECs (not including those actions considered in this Amendment document).

Action	Description	Impacts on Managed Resource	Impacts on Non-target Species	Impacts on Habitat and EFH	Impacts on Protected Species	Impacts on Human Communities
RFF Implementation of Data Collection Protocol (within 3 years)	Collect data needed to track ITQ share ownership within the fishery	Neutral Administrative - no direct or indirect impacts	Neutral Administrative - no direct or indirect impacts	Neutral Administrative - no direct or indirect impacts	Neutral Administrative - no direct or indirect impacts	Uncertain – Likely Mixed Collects data needed to evaluate excessive shares cap, but additional paperwork may be required
RFF Amendment to address Cost Recovery (within 3 years)	Recover costs associated with management of the fishery; EFH Updates; BRP Updates	Neutral to Positive Administrative costs recovery- no direct or indirect impacts, but EFH updates and BRP updates positive	Neutral Administrative - no direct or indirect impacts	Neutral to Positive Administrative costs recovery- no direct or indirect impacts, but EFH updates positive	Neutral Administrative - no direct or indirect impacts	Uncertain – Likely Mixed Industry will have to provide funds to cover costs of management; taxpayers will not have to cover costs
RFF Amendment to address Excessive Shares (begin work within 3 years)	Establish a cap for excessive share accumulation	Neutral Administrative - no direct or indirect impacts	Neutral Administrative - no direct or indirect impacts	Neutral Administrative - no direct or indirect impacts	Neutral Administrative - no direct or indirect impacts	Indirect Positive Protects against excessive share accumulation in fishery

7.5.5.1 Managed Resources

Those past, present, and reasonably foreseeable future actions, whose effects may impact the managed resources and the direction of those potential impacts, are summarized in Table 10. The indirectly negative actions described in Table 10 are mainly localized in nearshore areas and marine project areas where they occur. Therefore, the magnitude of those impacts on the managed resources is expected to be limited due to a lack of exposure to the population at large. Agricultural runoff may be much broader in scope, and the impacts of nutrient inputs to the coastal system may be of a larger magnitude, although the impact on productivity of the managed resources is unquantifiable. As described above (section 7.5.4), NOAA Fisheries has several means under which it can review non-fishing actions of other federal or state agencies that may impact NOAA Fisheries managed resources prior to permitting or implementation of those projects. This serves to minimize the extent and magnitude of indirect negative impacts those actions could have on resources under NOAA Fisheries jurisdiction.

Past fishery management actions taken through the FMP and specification process have had a positive cumulative effect on the managed resources. It is anticipated that the future management actions, described in Table 11, will result in additional indirect positive effects on the managed resources through actions which reduce and monitor bycatch, protect habitat, and protect ecosystem services on which surfclam and ocean quahog productivity depends. The 2012 fishing year was the first year of implementation for an Amendment which requires specification of ACLs and ACTs, and this process has been carried forward into the 2014-2016 proposed measures. This represents a major change to the current management program and is expected to lead to improvements in resource sustainability over the long-term. These impacts could be broad in scope. Overall, the past, present, and reasonably foreseeable future actions that are truly meaningful to surfclam and ocean quahog have had a positive cumulative effect.

Catch limits, and commercial quotas for each of the managed resources have been specified to ensure these rebuilt stocks are managed in a sustainable manner, and measures are consistent with the objectives of the FMP under the guidance of the MSA. The impacts from specification of management measures established in previous years on the managed resources are largely dependent on how effective those measures were in meeting their intended objectives (i.e., preventing overfishing, achieve OY) and the extent to which mitigating measures were effective. The proposed action in this document would positively reinforce the past and anticipated positive cumulative effects on the surfclam and ocean quahog stock, by achieving the objectives specified in the FMP and ensuring the requirements of the MSA are met. Therefore, the proposed action would not have any significant effect on the managed resources individually or in conjunction with other anthropogenic activities (see Table 11).

Table 11. Summary of the effects of past, present, and reasonably foreseeable future actions on the managed resource.

Action	Past to the Present	Reasonably Foreseeable Future
Original FMP and subsequent Amendments and Frameworks to the FMP	Indirect Positive	
Surfclam and Ocean Quahog Specifications	Indirect Positive	
Developed, Apply, and Redo Standardized Bycatch Reporting Methodology	Neutral	
PSP Closed Areas		Neutral to Indirect Negative
Agricultural runoff	Indirect Negative	
Port maintenance	Uncertain – Likely Indirect Negative	
Offshore disposal of dredged materials	Indirect Negative	
Beach nourishment – Offshore mining	Indirect Negative	
Beach nourishment – Sand placement	Indirect Negative	
Marine transportation	Indirect Negative	
Installation of pipelines, utility lines and cables	Uncertain – Likely Indirect Negative	
National Offshore Aquaculture Act of 2007	Potentially Indirect Negative	
Offshore Wind Energy Facilities (within 3 years)		Uncertain – Likely Indirect Negative
Liquefied Natural Gas (LNG) terminals (within 3 years)		Uncertain – Likely Indirect Negative
Convening Gear Take Reduction Teams (within 3 years)		Indirect Positive
Strategy for Sea Turtle Conservation for the Atlantic Ocean and the Gulf of Mexico Fisheries (within next 3 years)		Indirect Positive
Data Collection Protocol		Neutral
Amendment to Address Cost Recovery		Neutral to Positive
Amendment to Address Excessive Shares		Neutral
Summary of past, present, and future actions excluding those proposed in this amendment document	Overall, actions have had, or will have, positive impacts on the managed resources * See section 7.5.5.1 for explanation.	

7.5.5.2 Non-Target Species or Bycatch

Those past, present, and reasonably foreseeable future actions, whose effects may impact non-target species and the direction of those potential impacts, are summarized in Table 10. The effects of indirectly negative actions described in Table 10 are localized in nearshore areas and marine project areas where they occur. Therefore, the magnitude of those impacts on non-target species is expected to be limited due to a lack of exposure to the population at large. Agricultural runoff may be much broader in scope, and the impacts of nutrient inputs to the coastal system may be of a larger magnitude, although the impact on productivity of non-target resources and the oceanic ecosystem is unquantifiable. As described above (section 7.5.4), NOAA Fisheries has several means under which it can review non-fishing actions of other federal or state agencies that may impact NOAA Fisheries managed resources prior to permitting or implementation of those projects. At this time, NOAA Fisheries can consider impacts to non-target species (federally-managed or otherwise) and comment on potential impacts. This serves to minimize the extent and magnitude of indirect negative impacts those actions could have on resources within NOAA Fisheries jurisdiction.

Past fishery management actions taken through the FMP and annual specification process have had a positive cumulative effect on non-target species. Implementation and application of a standardized bycatch reporting methodology (SBRM) would have a particular impact on non-target species by improving the methods which can be used to assess the magnitude and extent of a potential bycatch problem. The redevelopment of the SBRM will result in better assessment of potential bycatch issues and allow more effective and specific management measures to be developed to address a bycatch problem. It is anticipated that future management actions, described in Table 12, will result in additional indirect positive effects on non-target species through actions which reduce and monitor bycatch, protect habitat, and protect ecosystem services on which the productivity of many of these non-target resources depend. The impacts of these future actions could be broad in scope, and it should be noted the managed resource and non-target species are often coupled in that they utilize similar habitat areas and ecosystem resources on which they depend. Overall, the past, present, and reasonably foreseeable future actions that are truly meaningful have had a positive cumulative effect on non-target species.

Catch limits and commercial quotas for each of the managed resources have been specified to ensure these rebuilt stocks are managed in a sustainable manner, and measures are consistent with the objectives of the FMP under the guidance of the MSA. The proposed actions in this document would not change the past and anticipated positive cumulative effects on non-target species and thus, would not have any significant effect on these species individually or in conjunction with other anthropogenic activities (Table 12).

Table 12. Summary of the effects of past, present, and reasonably foreseeable future actions on the non-target species.

Action	Past to the Present	Reasonably Foreseeable Future
Original FMP and subsequent Amendments and Frameworks to the FMP	Indirect Positive	
Surfclam and Ocean Quahog Specifications	Indirect Positive	
Developed, Apply, and Redo Standardized Bycatch Reporting Methodology	Neutral	
PSP Closed Areas		Potentially Indirect Positive
Agricultural runoff	Indirect Negative	
Port maintenance	Uncertain – Likely Indirect Negative	
Offshore disposal of dredged materials	Indirect Negative	
Beach nourishment – Offshore mining	Indirect Negative	
Beach nourishment – Sand placement	Indirect Negative	
Marine transportation	Indirect Negative	
Installation of pipelines, utility lines and cables	Uncertain – Likely Indirect Negative	
National Offshore Aquaculture Act of 2007	Potentially Indirect Negative	
Offshore Wind Energy Facilities (within 3 years)		Uncertain – Likely Indirect Negative
Liquefied Natural Gas (LNG) terminals (within 3 years)		Uncertain – Likely Indirect Negative
Convening Gear Take Reduction Teams (within 3 years)		Indirect Positive
Strategy for Sea Turtle Conservation for the Atlantic Ocean and the Gulf of Mexico Fisheries (within next 3 years)		Indirect Positive
Data Collection Protocol		Neutral
Amendment to Address Cost Recovery		Neutral
Amendment to Address Excessive Shares		Neutral
Summary of past, present, and future actions excluding those proposed in this amendment document	Overall, actions have had, or will have, positive impacts on the non-target species * See section 7.5.5.2 for explanation.	

7.5.5.3 Habitat (Including EFH)

Those past, present, and reasonably foreseeable future actions, whose effects may impact habitat (including EFH) and the direction of those potential impacts, are summarized in Table 10. The direct and indirect negative actions described in Table 10 are localized in nearshore areas and marine project areas where they occur. Therefore, the magnitude of those impacts on habitat is expected to be limited due to a lack of exposure to habitat at large. Agricultural runoff may be much broader in scope, and the impacts of nutrient inputs to the coastal system may be of a larger magnitude, although the impact on habitat and EFH is unquantifiable. As described above (section 7.5.4), NOAA Fisheries has several means under which it can review non-fishing actions of other federal or state agencies that may impact NOAA Fisheries managed resources and the habitat on which they rely prior to permitting or implementation of those projects. This serves to minimize the extent and magnitude of direct and indirect negative impacts those actions could have on habitat utilized by resources under NOAA Fisheries jurisdiction.

Past fishery management actions taken through the FMP and annual specification process have had a positive cumulative effect on habitat and EFH. The actions have constrained fishing effort at a large scale and locally, and have implemented gear requirements, which may reduce habitat impacts. As required under these FMP actions, EFH was designated for the managed resources. It is anticipated that the future management actions, described in Table 13, will result in additional direct or indirect positive effects on habitat through actions which protect EFH for federally-managed species and protect ecosystem services on which these species' productivity depends. These impacts could be broad in scope. All of the VECs are interrelated; therefore, the linkages among habitat quality and EFH, managed resources and non-target species productivity, and associated fishery yields should be considered. For habitat and EFH, there are direct and indirect negative effects from actions which may be localized or broad in scope; however, positive actions that have broad implications have been, and it is anticipated will continue to be, taken to improve the condition of habitat. There are some actions, which are beyond the scope of NOAA Fisheries and Council management such as coastal population growth and climate changes, which may indirectly impact habitat and ecosystem productivity. Overall, the past, present, and reasonably foreseeable future actions that are truly meaningful to habitat have had a neutral to positive cumulative effect.

Catch limits and commercial quotas for each of the managed resources have been specified to ensure these rebuilt stocks are managed in a sustainable manner, and measures are consistent with the objectives of the FMP under the guidance of the MSA. Proposed changes in Omnibus EFH Amendment 2 being prepared by the New England Fishery management Council are expected to go into effect in 2015. These actions could include closure of some areas near Nantucket Shoals and Great South Channel to clam dredging, although it is unclear if these measures will or will not go into effect. Closure of areas to dredging would not be expected to negatively impact EFH. The proposed actions in this document would not change the past and anticipated cumulative effects on habitat and thus, would not have any significant effect on habitat individually or in conjunction with other anthropogenic activities (Table 13).

Table 13. Summary of the effects of past, present, and reasonably foreseeable future actions on the habitat.

Action	Past to the Present	Reasonably Foreseeable Future
Original FMP and subsequent Amendments and Frameworks to the FMP	Indirect Positive	
Surfclam and Ocean Quahog Specifications	Indirect Positive	
Developed, Apply, and Redo Standardized Bycatch Reporting Methodology	Neutral	
PSP Closed Areas		Potentially Indirect Positive
Agricultural runoff	Direct Negative	
Port maintenance	Uncertain – Likely Direct Negative	
Offshore disposal of dredged materials	Direct Negative	
Beach nourishment – Offshore mining	Direct Negative	
Beach nourishment – Sand placement	Direct Negative	
Marine transportation	Direct Negative	
Installation of pipelines, utility lines and cables	Uncertain – Likely Direct Negative	
National Offshore Aquaculture Act of 2007	Direct Negative	
Offshore Wind Energy Facilities (within 3 years)		Potentially Direct Negative
Liquefied Natural Gas (LNG) terminals (within 3 years)		Potentially Direct Negative
Convening Gear Take Reduction Teams (within 3 years)		Indirect Positive
Strategy for Sea Turtle Conservation for the Atlantic Ocean and the Gulf of Mexico Fisheries (within next 3 years)		Indirect Positive
Data Collection Protocol		Neutral
Amendment to Address Cost Recovery		Neutral to Positive
Amendment to Address Excessive Shares		Neutral
Summary of past, present, and future actions excluding those proposed in this amendment document	Overall, actions have had, or will have, neutral to positive impacts on habitat, including EFH * See section 7.5.5.3 for explanation.	

7.5.5.4 ESA-Listed and MMPA Protected Species

Those past, present, and reasonably foreseeable future actions, whose effects may impact the protected resources and the direction of those potential impacts, are summarized in Table 10. The indirectly negative actions described in Table 10 are localized in nearshore areas and marine project areas where they occur. Therefore, the magnitude of those impacts on protected resources, relative to the range of many of the protected resources, is expected to be limited due to a lack of exposure to the population at large. Agricultural runoff may be much broader in scope, and the impacts of nutrient inputs to the coastal system may be of a larger magnitude, although the impact on protected resources either directly or indirectly is unquantifiable. As described above (section 7.5.4), NOAA Fisheries has several means, including ESA, under which it can review non-fishing actions of other federal or state agencies that may impact NOAA Fisheries protected resources prior to permitting or implementation of those projects. This serves to minimize the extent and magnitude of indirect negative impacts those actions could have on protected resources under NOAA Fisheries jurisdiction.

Past fishery management actions taken through the FMP and annual specification process have had a positive cumulative effect on ESA-listed and MMPA protected species through the reduction of fishing effort (potential interactions) and implementation of gear requirements. It is anticipated that the future management actions, specifically those recommended by the ALWTRT and the development of strategies for sea turtle conservation described in Table 14, will result in additional indirect positive effects on the protected resources. These impacts could be broad in scope. Overall, the past, present, and reasonably foreseeable future actions that are truly meaningful to protected resources have had a positive cumulative effect.

Catch limits and commercial quotas for each of the managed resources have been specified to ensure these rebuilt stocks are managed in a sustainable manner, and measures are consistent with the objectives of the FMP under the guidance of the MSA. The proposed actions in this document would not change the past and anticipated cumulative effects on ESA-listed and MMPA protected species and thus, would not have any significant effect on protected resources individually or in conjunction with other anthropogenic activities (Table 14).

Table 14. Summary of the effects of past, present, and reasonably foreseeable future actions on the protected resources.

Action	Past to the Present	Reasonably Foreseeable Future
Original FMP and subsequent Amendments and Frameworks to the FMP	Indirect Positive	
Surfclam and Ocean Quahog Specifications	Indirect Positive	
Developed, Apply, and Redo Standardized Bycatch Reporting Methodology	Neutral	
PSP Closed Areas		Potentially Indirect Positive
Agricultural runoff	Indirect Negative	
Port maintenance	Uncertain – Likely Indirect Negative	
Offshore disposal of dredged materials	Indirect Negative	
Beach nourishment – Offshore mining	Indirect Negative	
Beach nourishment – Sand placement	Indirect Negative	
Marine transportation	Indirect Negative	
Installation of pipelines, utility lines and cables	Potentially Direct Negative	
National Offshore Aquaculture Act of 2007	Potentially Indirect Negative	
Offshore Wind Energy Facilities (within 3 years)		Uncertain – Likely Indirect Negative
Liquefied Natural Gas (LNG) terminals (within 3 years)		Uncertain – Likely Indirect Negative
Convening Gear Take Reduction Teams (within 3 years)		Indirect Positive
Strategy for Sea Turtle Conservation for the Atlantic Ocean and the Gulf of Mexico Fisheries (within next 3 years)		Indirect Positive
Data Collection Protocol		Neutral
Amendment to Address Cost Recovery		Neutral
Amendment to Address Excessive Shares		Neutral
Summary of past, present, and future actions excluding those proposed in this amendment document	Overall, actions have had, or will have, positive impacts on protected resources * See section 7.5.5.4 for explanation.	

7.5.5.5 Human Communities

Those past, present, and reasonably foreseeable future actions, whose effects may impact human communities and the direction of those potential impacts, are summarized in Table 10. The indirectly negative actions described in Table 10 are localized in nearshore areas and marine project areas where they occur. Therefore, the magnitude of those impacts on human communities is expected to be limited in scope. It may, however, displace fishermen from project areas. Agricultural runoff may be much broader in scope, and the impacts of nutrient inputs to the coastal system may be of a larger magnitude. This may result in indirect negative impacts on human communities by reducing resource availability; however, this effect is unquantifiable. As described above (section 7.5.4), NOAA Fisheries has several means under which it can review non-fishing actions of other federal or state agencies prior to permitting or implementation of those projects. This serves to minimize the extent and magnitude of indirect negative impacts those actions could have on human communities.

Past fishery management actions taken through the FMP and annual specification process have had both positive and negative cumulative effects by benefiting domestic fisheries through sustainable fishery management practices, while at the same time potentially reducing the availability of the resource to all participants. Sustainable management practices are, however, expected to yield broad positive impacts to fishermen, their communities, businesses, and the nation as a whole. It is anticipated that the future management actions, described in Table 15, will result in positive effects for human communities due to sustainable management practices, although additional indirect negative effects on the human communities could occur through management actions that may implement gear requirements or area closures and thus, reduce revenues. Overall, the past, present, and reasonably foreseeable future actions that are truly meaningful to human communities have had an overall positive cumulative effect.

Catch limits and commercial quotas for each of the managed resources have been specified to ensure these rebuilt stocks are managed in a sustainable manner, and measures are consistent with the objectives of the FMP under the guidance of the MSA.

Despite the potential for negative short-term effects on human communities, the expectation is that there would be a positive long-term effect on human communities due to the long-term sustainability of surfclam and ocean quahog. Overall, the proposed actions in this document would not change the past and anticipated cumulative effects on human communities and thus, would not have any significant effect on human communities individually, or in conjunction with other anthropogenic activities (Table 15).

Table 15. Summary of the effects of past, present, and reasonably foreseeable future actions on human communities.

Action	Past to the Present	Reasonably Foreseeable Future
Original FMP and subsequent Amendments and Frameworks to the FMP	Indirect Positive	
Surfclam and Ocean Quahog Specifications	Indirect Positive	
Developed, Apply, and Redo Standardized Bycatch Reporting Methodology	Potentially Indirect Negative	
PSP Closed Areas		Potentially Indirect Positive
Agricultural runoff	Indirect Negative	
Port maintenance	Uncertain – Likely Mixed	
Offshore disposal of dredged materials	Indirect Negative	
Beach nourishment – Offshore mining	Mixed	
Beach nourishment – Sand placement	Positive	
Marine transportation	Mixed	
Installation of pipelines, utility lines and cables	Uncertain – Likely Mixed	
National Offshore Aquaculture Act of 2007	Uncertain – Likely Mixed	
Offshore Wind Energy Facilities (within 3 years)		Uncertain – Likely Mixed
Liquefied Natural Gas (LNG) terminals (within 3 years)		Uncertain – Likely Mixed
Convening Gear Take Reduction Teams (within 3 years)		Indirect Negative
Strategy for Sea Turtle Conservation for the Atlantic Ocean and the Gulf of Mexico Fisheries (within next 3 years)		Indirect Negative
Data Collection Protocol		Uncertain – Likely Mixed
Amendment to Address Cost Recovery		Direct Negative
Amendment to Address Excessive Shares		Indirect Positive
Summary of past, present, and future actions excluding those proposed in this amendment document	Overall, actions have had, or will have, positive impacts on human communities * See section 7.5.5.5 for explanation.	

7.5.6 Preferred Action on all the VECS

[This section will be completed when the Council has identified preferred measures]

8.0 APPLICABLE LAWS

8.1 Magnuson-Stevens Fishery Conservation and Management Act (MSA)

8.1.1 National Standards

Section 301 of the MSA requires that FMPs contain conservation and management measures that are consistent with the ten National Standards. The most recent FMP amendments address how the management actions implemented comply with the National Standards. First and foremost, the Council continues to meet the obligations of National Standard 1 by adopting and implementing conservation and management measures that will continue to prevent overfishing, while achieving, on a continuing basis, the optimum yield for Atlantic surfclam and ocean quahog and the U.S. fishing industry. To achieve OY, both scientific and management uncertainty need to be addressed when establishing catch limits that are less than the OFL; therefore, the Council develops recommendations that do not exceed the ABC recommendations of the SSC which have been developed to explicitly address scientific uncertainty. In addition, the Council has considered relevant sources of management uncertainty and other social, economic, and ecological factors, which resulted in recommendations for annual catch targets for both managed resources. The Council uses the best scientific information available (National Standard 2) and manages both species throughout their range (National Standard 3). These management measures do not discriminate among residents of different states (National Standard 4), they do not have economic allocation as their sole purpose (National Standard 5), the measures account for variations in these fisheries (National Standard 6), they avoid unnecessary duplication (National Standard 7), they take into account the fishing communities (National Standard 8) and they promote safety at sea (National Standard 10). Finally, actions taken are consistent with National Standard 9, which addresses bycatch in fisheries. The Council has implemented many regulations that have indirectly acted to reduce fishing gear impacts on EFH. By continuing to meet the National Standards requirements of the MSA through future FMP amendments, framework actions, and the annual specification setting process, the Council will insure that cumulative impacts of these actions will remain positive overall for the ports and communities that depend on these fisheries, the Nation as a whole, and certainly for the resources.

8.2 NEPA FINDING OF NO SIGNIFICANT IMPACT (FONSI)

[This section will be completed prior to submission to NOAA Fisheries]

National Oceanic and Atmospheric Administration Administrative Order 216-6 (May 20, 1999) contains criteria for determining the significance of the impacts of a proposed action. In addition, the CEQ regulations at 40 CFR §1508.27 state that the significance of an action should be analyzed both in terms of “context” and “intensity.” Each criterion listed below is relevant to making a finding of no significant impact and has been considered individually, as well as in combination with the others. The significance of this action is analyzed based on the NAO 216-6 criteria and CEQ's context and intensity criteria. These include:

1) Can the proposed action reasonably be expected to jeopardize the sustainability of any target species that may be affected by the action?

- 2) *Can the proposed action reasonably be expected to jeopardize the sustainability of any non-target species?*
- 3) *Can the proposed action reasonably be expected to cause substantial damage to the ocean and coastal habitats and/or essential fish habitat as defined under the Magnuson-Stevens Act and identified in FMPs?*
- 4) *Can the proposed action be reasonably expected to have a substantial adverse impact on public health or safety?*
- 5) *Can the proposed action reasonably be expected to adversely affect endangered or threatened species, marine mammals, or critical habitat of these species?*
- 6) *Can the proposed action be expected to have a substantial impact on biodiversity and/or ecosystem function within the affected area (e.g., benthic productivity, predator-prey relationships, etc.)?*
- 7) *Are significant social or economic impacts interrelated with natural or physical environmental effects?*
- 8) *Are the effects on the quality of the human environment likely to be highly controversial?*
- 9) *Can the proposed action reasonably be expected to result in substantial impacts to unique areas, such as historic or cultural resources, park land, prime farmlands, wetlands, wild and scenic rivers or ecologically critical areas?*
- 10) *Are the effects on the human environment likely to be highly uncertain or involve unique or unknown risks?*
- 11) *Is the proposed action related to other actions with individually insignificant, but cumulatively significant impacts?*
- 12) *Is the proposed action likely to adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places or may cause loss or destruction of significant scientific, cultural or historical resources?*
- 13) *Can the proposed action reasonably be expected to result in the introduction or spread of a nonindigenous species?*
- 14) *Is the proposed action likely to establish a precedent for future actions with significant effects or represents a decision in principle about a future consideration?*
- 15) *Can the proposed action reasonably be expected to threaten a violation of federal, State, or local law or requirements imposed for the protection of the environment?*

16) Can the proposed action reasonably be expected to result in cumulative adverse effects that could have a substantial effect on the target species or non-target species?

8.3 Endangered Species Act

Sections 6.3 and 7.0 should be referenced for an assessment of the impacts of the proposed action on ESA-listed and MMPA protected resources. None of the actions proposed in this document are expected to alter fishing methods or activities. Therefore, this action is not expected to affect endangered or threatened species or critical habitat in any manner not considered in previous consultations on these fisheries.

8.4 Marine Mammal Protection Act

Sections 6.3 and 7.0 should be referenced for an assessment of the impacts of the proposed action on marine mammals protected under the MMPA. None of the actions proposed in this document are expected to alter fishing methods or activities. Therefore, this action is not expected to affect marine mammals or critical habitat in any manner not considered in previous consultations on the fisheries.

8.5 Coastal Zone Management Act

The Coastal Zone Management Act (CZMA) of 1972, as amended, provides measures for ensuring stability of productive fishery habitat while striving to balance development pressures with social, economic, cultural, and other impacts on the coastal zone. It is recognized that responsible management of both coastal zones and fish stocks must involve mutually supportive goals. The Council has developed this amendment document and will submit it to NOAA Fisheries; NOAA Fisheries must determine whether this action is consistent to the maximum extent practicable with the CZM programs for each state (Maine through North Carolina).

8.6 Administrative Procedure Act

Sections 551-553 of the Federal Administrative Procedure Act establish procedural requirements applicable to informal rulemaking by federal agencies. The purpose is to ensure public access to the federal rulemaking process and to give the public notice and opportunity to comment before the agency promulgates new regulations.

The Administrative Procedure Act requires solicitation and review of public comments on actions taken in the development of an FMP and subsequent amendments and framework adjustments. Development of this amendment document provided many opportunities for public review, input, and access to the rulemaking process. This action and the proposed measures was developed through a multi-stage process that was open to review by affected members of the public. The public had the opportunity to review and comment on management measures during the Council meeting in August 2013, June 2014, and October 2014. Fishery Management Action Team Meetings (in-person and via webinar) were also open to the public. Public hearings will be held and provide addition opportunity for comment from the public, prior to the Council's decision to submit the document to NOAA Fisheries. In addition, the public will have further opportunity to

comment on this amendment document when NOAA Fisheries publishes a request for comments notice in the Federal Register (FR).

8.7 Section 515 (Data Quality Act)

Utility of Information Product

This action proposes measures for collecting fees and recovering costs associated with the management of the Atlantic surfclam and ocean quahog ITQ fisheries, measures that facilitate incorporation of revised stock status determination criteria (i.e., biological reference points) for surfclams and ocean quahogs into the FMP, and measures that would modify or eliminate the OY ranges for surfclam and ocean quahog currently in the FMP. This document includes: A description of the alternatives considered, the preferred action and rationale for selection, and any changes to the implementing regulations of the FMP (if applicable). As such, this document enables the implementing agency (NOAA Fisheries) to make a decision on implementation and this document serves as a supporting document for the proposed rule.

The action contained within this amendment document was developed to be consistent with the FMP, MSA, and other applicable laws, through a multi-stage process that was open to review by affected members of the public. The public had the opportunity to review and comment on management measures during a number of public meetings (see section 8.6). In addition, the public will have further opportunity to comment on this amendment document once NOAA Fisheries publishes a request for comments notice in the FR.

Integrity of Information Product

The information product meets the standards for integrity under the following types of documents: Other/Discussion (e.g., Confidentiality of Statistics of the MSA; NOAA Administrative Order 216-100, Protection of Confidential Fisheries Statistics; 50 CFR 229.11, Confidentiality of information collected under the MMPA).

Objectivity of Information Product

The category of information product that applies here is “Natural Resource Plans.” This section (section 8.0) describes how this document was developed to be consistent with any applicable laws, including MSA with any of the applicable National Standards. The analyses used to develop the alternatives (i.e., policy choices) are based upon the best scientific information available and the most up to date information is used to develop the EA which evaluates the impacts of those alternatives (see section 7.0 of this document for additional details). The specialists who worked with these core data sets and population assessment models are familiar with the most recent analytical techniques and are familiar with the available data and information relevant to the surfclam and ocean quahog fisheries.

The review process for this amendment document involves MAFMC, NEFSC, GARFO, and NOAA Fisheries headquarters. The NEFSC technical review is conducted by senior level scientists with specialties in fisheries ecology, population dynamics and biology, as well as economics and

social anthropology. The MAFMC review process involves public meetings at which affected stakeholders have the opportunity to comments on proposed management measures. Review by GARFO is conducted by those with expertise in fisheries management and policy, habitat conservation, protected resources, and compliance with the applicable law. Final approval of the specifications document and clearance of the rule is conducted by staff at NOAA Fisheries Headquarters, the Department of Commerce, and the U.S. Office of Management and Budget.

8.8 Paperwork Reduction Act

The Paperwork Reduction Act (PRA) concerns the collection of information. The intent of the PRA is to minimize the federal paperwork burden for individuals, small businesses, state and local governments, and other persons as well as to maximize the usefulness of information collected by the Federal government. This action will contain a collection-of-information requirement for purposes of the PRA. Under the proposed cost recovery program, ITQ shareholders, or dealers may be required to provide tax identification numbers or a social security number. In addition, the payment of bills under cost recovery (and any rebates, refunds) associated with the payment system may require that additional information be provided.

8.9 Impacts of the Plan Relative to Federalism/EO 13132

This document does not contain policies with federalism implications sufficient to warrant preparation of a federalism assessment under Executive Order (EO) 13132.

8.10 Environmental Justice/EO 12898

This EO provides that “each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations.” EO 12898 directs each Federal agency to analyze the environmental effects, including human health, economic, and social effects of Federal actions on minority populations, low-income populations, and Indian tribes, when such analysis is required by NEPA. Agencies are further directed to “identify potential effects and mitigation measures in consultation with affected communities, and improve the accessibility of meetings, crucial documents, and notices.”

The proposed actions are not expected to affect participation in the surfclam and ocean quahog fisheries. Since the proposed action represents no changes relative to the current levels of participation in these fisheries, no negative economic or social effects in the context of EO 12898 are anticipated as a result. Therefore, the proposed action is not expected to cause disproportionately high and adverse human health, environmental or economic effects on minority populations, low-income populations, or Indian tribes.

8.11 Regulatory Impact Review/Regulatory Flexibility Analysis

The NOAA Fisheries requires the preparation of a Regulatory Impact Review (RIR) for all regulatory actions that either implement a new Fishery Management Plan (FMP) or significantly amend an existing plan. This RIR is part of the process of preparing and reviewing FMPs and provides a comprehensive review of the changes in net economic benefits to society associated with proposed regulatory actions. This analysis also provides a review of the problems and policy objectives prompting the regulatory proposals and an evaluation of the major alternatives that could be used to solve the problems. The purpose of this analysis is to ensure that the regulatory agency systematically and comprehensively considers all available alternatives so that the public welfare can be enhanced in the most efficient and cost-effective way. This RIR addresses many items in the regulatory philosophy and principles of EO 12866.

The Regulatory Flexibility Act (RFA) requires the Federal rulemaker to examine the impacts of proposed and existing rules on small businesses, small organizations, and small governmental jurisdictions. In reviewing the potential impacts of proposed regulations, the agency must either certify that the rule “will not, if promulgated, have a significant economic impact on a substantial number of small entities.” As indicated in section 5.0, the proposed actions in this document would implement measures for collecting fees and recovering costs associated with the management of the Atlantic surfclam and ocean quahog ITQ fisheries, measures that facilitate incorporation of revised stock status determination criteria (i.e., biological reference points) for surfclams and ocean quahog into the FMP, and measures that would modify or eliminate the OY ranges for surfclam and ocean quahog currently in the FMP. An Initial Regulatory Flexibility Analysis (IRFA) will be prepared to further evaluate the economic impacts of the various alternatives presented once the Council has identified preferred alternatives. This analysis supports a more thorough analysis (RFA) which will be completed.

10.0 LIST OF AGENCIES AND PERSONS CONSULTED

In preparing this document, the Council consulted with NOAA Fisheries, New England and South Atlantic Fishery Management Councils, Fish and Wildlife Service, and the states of Maine through North Carolina through their membership on the Mid-Atlantic and New England Fishery Management Councils. To ensure compliance with NOAA Fisheries formatting requirements, the advice of NOAA Fisheries GARFO personnel was sought.

Mid-Atlantic Fishery Management Council,
Suite 201, 800 North State Street,
Dover, DE 19901**

APPENDIX A

Table 1. Essential Fish Habitat descriptions for federally-managed species/life stages in the U.S. Northeast Shelf Ecosystem that are vulnerable to bottom tending fishing gear.

Species	Life Stage	Geographic Area of EFH	Depth (meters)	Bottom Type
American plaice	juvenile	GOM, including estuaries from Passamaquoddy Bay to Saco Bay, ME and from Massachusetts Bay to Cape Cod Bay	45 - 150	Fine grained sediments, sand, or gravel
American plaice	adult	GOM, including estuaries from Passamaquoddy Bay to Saco Bay, ME and from Massachusetts Bay to Cape Cod Bay	45 - 175	Fine grained sediments, sand, or gravel
Atlantic cod	juvenile	GOM, GB, eastern portion of continental shelf off SNE, these estuaries: Passamaquoddy Bay to Saco Bay, Massachusetts Bay, Boston Harbor, Cape Cod Bay, Buzzards Bay	25 - 75	Cobble or gravel
Atlantic cod	adult	GOM, GB, eastern portion of continental shelf off SNE, these estuaries: Passamaquoddy Bay to Saco Bay, Massachusetts Bay, Boston Harbor, Cape Cod Bay, Buzzards Bay	10 - 150	Rocks, pebbles, or gravel
Atl halibut	juvenile	GOM and GB	20 - 60	Sand, gravel, or clay
Atl halibut	adult	GOM and GB	100 - 700	Sand, gravel, or clay
Barndoor skate	juvenile/ adult	Eastern GOM, GB, SNE, Mid-Atlantic Bight to Hudson Canyon	10-750, most < 150	Mud, gravel, and sand
Black sea bass	juvenile	GOM to Cape Hatteras, NC, including estuaries from Buzzards Bay to Long Island Sound, Gardiners Bay, Barnegat Bay to Chesapeake Bay, Tangier/ Pocomoke Sound, and James River	1 - 38	Rough bottom, shellfish/eelgrass beds, manmade structures, offshore clam beds, and shell patches
Black sea bass	adult	GOM to Cape Hatteras, NC, including Buzzards Bay, Narragansett Bay, Gardiners Bay, Great South Bay, Barnegat Bay to Chesapeake Bay, and James River	20 - 50	Structured habitats (natural and manmade), sand and shell substrates preferred
Clearnose skate	juvenile/ adult	GOM, along continental shelf to Cape Hatteras, NC, including the estuaries from Hudson River/Raritan Bay south to the Chesapeake Bay mainstem	0 – 500, most < 111	Soft bottom and rocky or gravelly bottom
Haddock	juvenile	GB, GOM, and Mid-Atlantic south to Delaware Bay	35 - 100	Pebble and gravel
Haddock	adult	GB, eastern side of Nantucket Shoals, and throughout GOM	40 - 150	Broken ground, pebbles, smooth hard sand, and smooth areas between rocky patches
Little skate	juvenile/ adult	GB through Mid-Atlantic Bight to Cape Hatteras, NC; includes estuaries from Buzzards Bay south to mainstem Chesapeake Bay	0-137, most 73 - 91	Sandy or gravelly substrate or mud
Ocean pout	eggs	GOM, GB, SNE, and Mid-Atlantic south to Delaware Bay, including the following estuaries: Passamaquoddy Bay to Saco Bay, Massachusetts Bay and Cape Cod Bay	<50	Generally sheltered nests in hard bottom in holes or crevices
Ocean pout	juvenile	GOM, GB, SNE, Mid-Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Saco Bay, Massachusetts Bay, and Cape Cod Bay	< 50	Close proximity to hard bottom nesting areas
Ocean pout	adult	GOM, GB, SNE, Mid-Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Saco Bay, MA Bay, Boston Harbor, and Cape Cod Bay	< 80	Smooth bottom near rocks or algae
Pollock	adult	GOME, GB, SNE, and Mid-Atlantic south to New Jersey and the following estuaries: Passamaquoddy Bay, Damariscotta R., MA Bay, Cape Cod Bay, Long Island Sound	15 – 365	Hard bottom habitats including artificial reefs

Species	Life Stage	Geographic Area of EFH	Depth (meters)	Bottom Type
Red hake	juvenile	GOM, GB, continental shelf off SNE, and Mid-Atlantic south to Cape Hatteras, including the following estuaries: Passamaquoddy Bay to Saco Bay, Great Bay, MA Bay to Cape Cod Bay; Buzzards Bay to CT River, Hudson River, Raritan Bay, and Chesapeake Bay	< 100	Shell fragments, including areas with an abundance of live scallops
Red hake	adult	GOM, GB, continental shelf off SNE, Mid-Atlantic south to Cape Hatteras, these estuaries: Passamaquoddy Bay to Saco Bay, Great Bay, MA Bay to Cape Cod Bay; Buzzards Bay to CT River, Hudson River, Raritan Bay, Delaware Bay, and Chesapeake Bay	10 - 130	In sand and mud, in depressions
Redfish	juvenile	GOM, southern edge of GB	25 - 400	Silt, mud, or hard bottom
Redfish	adult	GOM, southern edge of GB	50 - 350	Silt, mud, or hard bottom
Rosette skate	juvenile/ adult	Nantucket shoals and southern edge of GB to Cape Hatteras, NC	33-530, most 74-274	Soft substrate, including sand/mud bottoms
Scup	juvenile/ adult	GOM to Cape Hatteras, NC, including the following estuaries: MA Bay, Cape Cod Bay to Long Island Sound, Gardiners Bay to Delaware inland bays, and Chesapeake Bay	0-38 for juv 2-185 for adult	Demersal waters north of Cape Hatteras and inshore estuaries (various substrate types)
Silver hake	juvenile	GOM, GB, continental shelf off SNE, Mid-Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Casco Bay, ME, MA Bay to Cape Cod Bay	20 – 270	All substrate types
Summer Flounder	juvenile/ adult	GOM to Florida – estuarine and over continental shelf to shelf break	0-250	Demersal/estuarine waters, varied substrates. Mostly inshore in summer and offshore in winter.
Smooth skate	juvenile/ adult	Offshore banks of GOM	31–874, most 110-457	Soft mud (silt and clay), sand, broken shells, gravel and pebbles
Thorny skate	juvenile/ adult	GOM and GB	18-2000, most 111-366	Sand, gravel, broken shell, pebbles, and soft mud
Tilefish	juvenile/ adult	Outer continental shelf and slope from the U.S./Canadian boundary to the Virginia/North Carolina boundary	100 - 300	Burrows in clay (some may be semi-hardened into rock)
White hake	juvenile	GOM, southern edge of GB, SNE to Mid-Atlantic and the following estuaries: Passamaquoddy Bay, ME to Great Bay, NH, Massachusetts Bay to Cape Cod Bay	5 - 225	Seagrass beds, mud, or fine grained sand
Winter flounder	adult	GB, inshore areas of GOM, SNE, Mid- Atlantic south to Delaware Bay and the estuaries from Passamaquoddy Bay, ME to Chincoteague Bay, VA	1 - 100	Mud, sand, and gravel
Winter skate	juvenile/ adult	Cape Cod Bay, GB, SNE shelf through Mid-Atlantic Bight to North Carolina; includes the estuaries from Buzzards Bay south to the Chesapeake Bay mainstem	0 - 371, most < 111	Sand and gravel or mud
Witch flounder	juvenile	GOM, outer continental shelf from GB south to Cape Hatteras	50 - 450 to 1500	Fine grained substrate
Witch flounder	adult	GOME, outer continental shelf from GB south to Chesapeake Bay	25 - 300	Fine grained substrate
Yellowtail flounder	adult	GB, GOM, SNE and Mid-Atlantic south to Delaware Bay and these estuaries: Sheepscot River and Casco Bay, ME, MA Bay to Cape Cod Bay	20 - 50	Sand or sand and mud

APPENDIX C

**Golden Tilefish and Atlantic Sea Scallop Individual Fishing
Quota Cost Recovery Program Annual Reports**

2013 Annual Report of the Atlantic Sea Scallop Individual Fishing Quota Cost Recovery Program

May 2014

Prepared by:
Greater Atlantic Regional Fisheries Office
National Marine Fisheries Service
55 Great Republic Drive
Gloucester, MA 01930

Background

The Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) requires NOAA's National Marine Fisheries Service (NMFS) to collect fees to recover the "actual costs directly related to the management, data collection, and enforcement" of an individual fishing quota (IFQ) program (16 U.S.C. 1854(d)(2)). The law provides that IFQ allocation holders pay a fee based on the ex-vessel value of fish landed under the program. The fee may be as high as, but cannot exceed, 3 percent of the ex-vessel value of the fish harvested under the IFQ program. For the Limited Access General Category (LAGC) scallop IFQ program, the ex-vessel value is calculated as the average price paid per pound of scallops during the fee period multiplied by the total weight landed.

Although the scallop fishing year runs from March 1 through the last day of February, the cost recovery fee is based on expenses and landings made during the fee period, which runs from October 1 through September 30 each year. The 2013 fee period (October 1, 2012, through September 30, 2013) was the second time that NMFS collected fees from scallop IFQ vessels.

Use of Funds

Payments received as a result of the scallop IFQ cost recovery program are deposited in the Limited Access System Administrative Fund as required by the Magnuson-Stevens Act. Funds deposited in this account are available only to the Secretary of Commerce and may only be used to defray the costs of management and enforcement of the fishery for which the fees were collected. Therefore, fees collected as part of this cost recovery program will be used for management and enforcement of the scallop IFQ program.

Determining the Value of the Fishery

As required in the Scallop Fishery Management Plan (FMP), NMFS determines the value of the scallop IFQ fishery by multiplying the total landings of IFQ scallops by the average price paid by dealers to IFQ scallop vessels for IFQ scallops. While ex-vessel prices for scallops vary over the course of the fee period, the Scallop FMP requires that the price of all IFQ scallops landed during the entire fee period be the basis of the average price (as opposed to the average price per vessel, per month, or some other unit of scallop landings). Federally permitted scallop dealers must report the weight and price paid for all scallops purchased. From these data, we calculated an average price of \$11.30 paid to vessels participating in the scallop IFQ fishery during the 2013 fee period. The total of all LAGC IFQ landings during the 2013 fee period was 2,811,834 lb (shucked meats). Using this average price, we determined that the total value of LAGC IFQ landings was \$31,863,229 for the 2013 fee period. NMFS used this value to determine the overall fee percentage and the individual fees for vessel owners. We describe these determinations on page 4 of this report.

Cost of Management and Enforcement

The Magnuson-Stevens Act requires the collection of the IFQ fee to recover the actual costs of the program. We have determined that the recoverable costs associated with the management,

enforcement, and data collection for the scallop IFQ program include only the incremental costs of the IFQ program, and not the costs that would still have been incurred to administer the scallop fishery if there were no IFQ program. In addition, costs associated with the initial development of the IFQ program are not recoverable costs.

We calculated personnel costs by multiplying hours spent by staff on tasks directly related to the IFQ program, with the hourly salary rates for those individuals. Salary rates included the Government's share of benefits, prorated. We calculated contract expenses as the cost of contract employees prorated for the percentage of time the contract employees spent on tasks directly related to the IFQ program. In the 2013 fee period, the recoverable expenses primarily consisted of time spent by personnel working on tasks related to the administration of the IFQ program in the following Divisions:

Sustainable Fisheries Division (SFD)

SFD is primarily responsible for the management and implementation of the Atlantic sea scallop Fishery Management Plan, which includes the LAGC IFQ program. SFD staff provides oversight to the IFQ program and associated allocation monitoring and cost recovery requirements.

Analysis and Program Support Division (APS)

APS is responsible for most of the LAGC IFQ implementation tasks. These included issuing over 300 annual IFQ allocations and processing and tracking more than 350 temporary leases and permanent allocation transfers. APS is also responsible for generating individual fees, mailing bills, tracking payments, and following up on late payments under the cost recovery program.

APS is also responsible for data collection and analysis, including extensive quality control of incoming data sources and tracking of landings against IFQ allocations. Quality control is a critical function of APS and of any IFQ program because it ensures that the landings data NMFS uses to calculate IFQ usage and ultimately the individual fee is correct and consistent with owners' records. APS staff therefore committed time to working with vessel owners, dealers, and other NMFS offices to correct landings data.

Information Resource Management (IRM)

IRM is responsible for development and maintenance of the technological infrastructure of the scallop IFQ program. This infrastructure includes the internal databases and computer systems for handling allocations, the Fish-On-Line website, and the new web interface to the U.S. Department of the Treasury's Pay.gov service. These databases are critical to the monitoring of IFQ program because they track the individual landings, IFQ leasing, and permanent allocation transfers that take place in the LAGC IFQ fishery.

Operations and Budget Division (OBD)

OBD ensures that the calculations of program personnel and other costs are correct and meet required standards, as well as coordinates the use of collected receipts.

The Office of Law Enforcement (OLE)

OLE determined that there were no increased enforcement activities as a result of the scallop IFQ program, and, therefore, there were no recoverable expenses for enforcement.

Table 1 (below) provides details of how we calculated the recoverable costs per division within the Northeast Regional Office.

Table 1: Recoverable costs associated with management and enforcement of the scallop IFQ program, 2013 fee period.

Northeast Region Divisions	SFD	IRM	OLE	OBD	APS	FDS	Total
Personnel †	\$2,404	\$18,729	\$ -	\$7,573	\$54,161	\$0	\$82,867
Travel & Transportation	\$-	\$ -	\$ -	\$ -	\$678	\$ -	\$678
Printing	\$ -	\$ -	\$ -	\$ -	\$ -	\$ -	\$ -
Contracts	\$ -	\$1,393	\$ -	\$ -	\$ 33,554	\$0	\$34,947

Other	\$ -	\$ -	\$ -	\$ -	\$ -	\$ -	\$ -
Total	\$2,404	\$20,122	\$ -	\$7,573	\$88,412	\$	\$118,510

† Personnel costs include all benefits

Calculating the Fee as a Percentage of Total Fishery Value

We calculated that the recoverable costs for the scallop IFQ program for the 2013 fee period represent 0.0.3719 percent of the value of the scallop IFQ fishery. This fee percentage was calculated based on the total fishery value of \$31,773,719 and total recoverable program costs of \$118,510, using the following formula:

$$\frac{\$118,510}{\$31,863,229} \times 100 = 0.3719 \text{ percent}$$

This value of 0.3719 percent is less than the possible upper limit fee percentage of 3.0 percent (see background section, above). Thus, we were able to assess permit holders the total recoverable costs of fee period 2013.

Calculating Fees Assessed to Individual Permit Holders

Under the scallop IFQ program regulations, an LAGC IFQ permit holder is responsible for the IFQ fee based on the value of the landings of scallops attributed to his/her LAGC scallop IFQ permit, including landings made from an allocation that he/she leased from another IFQ holder. The allocation tracking program that we have developed is able to identify all scallop IFQ leases and attribute landings to the vessel that landed the scallops. To determine the appropriate IFQ

fee for each LAGC IFQ permit holder, we multiply the permit holder's landings by the average price and then by the fee percentage. This is represented by the following formula:

$$(\text{IFQ landings}) \times (\$11.30) \times (0.3719 \text{ percent}) = 2013 \text{ cost recovery fee}$$

Conclusion

We mailed bills for the scallop IFQ 2013 fee period to 154 LAGC IFQ permit holders on November 18 2013. Fees ranged from \$21.30 to \$3,147. Permit holders had until January 1, 2014, to pay the balance due through the Greater Atlantic Region's Pay.gov section of the Fish-On-Line website. Permit holders paid all fees and submitted no appeals of the fee calculations.

In the 2013 fee period, the total recoverable costs increased slightly from the previous year. This fee increase was a result of administrative time to implement Framework 24 mid-year allocation adjustments and time associated with implementing new IFQ leasing provisions.

2013 Annual Report of the Tilefish Individual Fishing Quota Cost Recovery Program

June 2014

Prepared by:
National Marine Fisheries Service
Greater Atlantic Regional Fisheries Office
55 Great Republic Drive
Gloucester, MA 01930

Background

The Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) requires NOAA's National Marine Fisheries Service (NMFS) to collect fees to recover the "actual costs directly related to the management, data collection, and enforcement" of an Individual Fishing Quota (IFQ) program (16 U.S.C. 1854(d)(2)). The law provides that the fee be paid by IFQ allocation shareholders, based on the ex-vessel value of fish landed under the program, where ex-vessel value is calculated as the price paid to the vessel per pound multiplied by the total weight landed. The fee may be up to, but cannot exceed, 3 percent of the ex-vessel value of the fish harvested under the IFQ program.

Although the tilefish fishing year runs from November 1 through October 31, the cost recovery fee is based on expenses and landings made during each calendar year. The 2013 calendar year (January 1, 2013, through December 31, 2013) was the fourth year for which this fee was collected.

Use of Funds

Payments received as a result of the tilefish IFQ cost recovery program are deposited in the Limited Access System Administrative Fund as required by the Magnuson-Stevens Act. Funds deposited in this account are available only to the Secretary of Commerce and may only be used to defray the costs of management and enforcement of the fishery for which the fees were collected. Therefore, fees collected as part of this cost recovery program will be used for management and enforcement of the tilefish IFQ program.

Determining Ex-Vessel Value

Because the fee obligation must be based on a percentage of the ex-vessel value of the tilefish IFQ fishery, it is necessary to calculate those values based on actual landings and the price paid to the vessel. Federally permitted tilefish dealers are required to report the weight and price paid for all tilefish purchased. Ex-vessel prices vary over the course of the year, but the small number of vessels and dealers participating in the tilefish IFQ fishery make it possible to use an exact total value from each landing of IFQ tilefish. For the 2013 calendar year, the total of all tilefish IFQ landings was 1,823,272 pounds (live weight) with a total ex-vessel value of \$5,787,335. This represents an increase in both landed weight and total value from 2012, when landings and ex-vessel value were 1,799,367 pounds (live weight) and \$5,372,921, respectively.

Cost of Management and Enforcement

The Magnuson-Stevens Act requires the collection of the IFQ fee to recover the actual costs of the program. We have determined the recoverable costs associated with the management, enforcement, and data collection in the tilefish IFQ program include only the incremental costs of the IFQ program, and not costs that would still have been incurred in the administration of the tilefish fishery if there was no IFQ program. In addition, costs associated with the initial development of the IFQ program are not included in recoverable costs. The inclusion of one-

time startup costs associated with the initial development of a new management system would greatly increase the fee in the first year of any IFQ program.

We calculated personnel costs by multiplying hours spent by staff on tasks directly related to the IFQ program with the hourly salary rates for those individuals. Salary rates include the Government's share of benefits on a prorated basis. We calculate contract expenses as the cost of contract employees prorated for the percentage of time the contract employees spent on tasks directly related to the IFQ program. In the 2013 fee period, the recoverable expenses primarily consisted of time spent by personnel working on tasks related to the administration of the IFQ program in the following divisions:

Sustainable Fisheries Division (SFD)

SFD has primary responsibility for the management and implementation of the Tilefish Fishery Management Plan, which includes the tilefish IFQ program. SFD staff provides oversight to the IFQ program and associated allocation monitoring and cost recovery components, and generates the annual report. SFD is the principal point of contact with the Mid-Atlantic Fishery Management Council and implements any needed and approved regulatory changes.

Analysis and Program Support Division (APSD)

APSD is responsible for most of the tasks associated with the ongoing operation of the tilefish IFQ program. These include annual IFQ allocation tasks such as issuing annual allocation permits and processing and tracking both temporary leases and permanent allocation transfers. This division also handles cost recovery tasks, such as generating individual fees, mailing bills, tracking payments, and following up on any late payments.

In 2013, our Regional Office underwent some organizational changes and the Fisheries Data Services Division was phased out. Many of the tasks previously done by this division were moved to APSD. These tasks include data collection and analysis, such as quality control of incoming data sources and tracking of landings against IFQ allocations. Data quality control is a critical function of any IFQ program. More than in most other fisheries, IFQ fisheries depend on timely processing and auditing of landings and dealer-reported price information from each fishing trip to ensure that landings are correctly attributed to individual allocations and that cost recovery fees are accurate and reflect the value of fish landed.

Information Resource Management (IRM)

IRM is responsible for development and maintenance of the technological infrastructure of the tilefish IFQ program. This infrastructure includes the internal databases and computer systems for handling allocations, the Fish-On-Line website, and the web interface to the U.S. Department of the Treasury's Pay.gov service. These databases are critical to the monitoring of the IFQ program because they track the individual landings, IFQ leasing, and permanent allocation transfers that take place in the tilefish IFQ fishery.

Operations and Budget Division (OBD)

OBD ensures the calculations of program personnel and other costs are correct and meet required standards. In addition, OBD coordinates the use of collected receipts to ensure that the money is used to support the management of the fishery in which it was collected.

Stakeholder Engagement Division (SED)

SED is the newest division in the Region, created in 2013. This division now contains our port agents in the Region, as well as our communications team. SED determined that there were no recoverable expenses associated with the tilefish IFQ program during 2013.

Office of Law Enforcement (OLE)

OLE special agents and enforcement officers ensure compliance with the Nation's marine resource laws and take enforcement action when these laws are violated. OLE determined there were no increased enforcement activities as a result of the tilefish IFQ program and, therefore, there were no recoverable expenses during 2013.

NOAA General Counsel (GC)

The Northeast Section of the NOAA Office of General Counsel provides legal advice to NMFS and the Councils and reviews management actions for consistency with applicable legal requirements. GC determined that there were no recoverable expenses associated with the tilefish IFQ program during 2013.

Table 1 provides details of how the recoverable costs were calculated by division within the Greater Atlantic Regional Fisheries Office of NMFS.

Table 1. Recoverable costs associated with management and enforcement of the tilefish IFQ program, 2013.

Greater Atlantic Region Divisions	SFD	APSD	IRM	OBD	SED	OLE	GC	Total
Personnel †	\$3,466	\$19,226	\$8,604	\$4,591	\$-	\$-	\$-	\$35,887

Greater Atlantic Region Divisions: SFD (Sustainable Fisheries); APSD (Analysis and Program Support); IRM (Information Resource Management); OBD (Operations and Budget); SED (Stakeholder Engagement Division); OLE (Office of Law Enforcement); GC (NOAA General Counsel).

† Personnel costs include all benefits

Calculating the Fee Percentage

The calculated 2013 tilefish IFQ fee percentage was 0.6214 percent. We calculated the fee percentage based on the total fishery ex-vessel value of \$5,787,335 and total recoverable program costs of \$35,966 using the following formula:

$$\frac{\$35,966}{\$5,787,335} \times 100 = 0.6214\%$$

Calculating IFQ Allocation Fees

To determine the appropriate fee for each IFQ allocation shareholder, we use the ex-vessel value of each landing of tilefish under a specific IFQ allocation and multiply the sum of those values by the fee percentage. Under the tilefish IFQ program regulations, an IFQ allocation shareholder is responsible for the IFQ fee based on the value of the landings of tilefish authorized under his/her tilefish initial IFQ allocation, including landings made on any allocation that he/she may have leased to another IFQ allocation permit holder. The allocation tracking program that we have developed is able to identify all tilefish IFQ leases and attribute landings to the original allocation shareholder. If a vessel landing tilefish has IFQ allocation available from both the vessel owner's initial allocation and from leased allocation, we attribute tilefish landings to the leased allocation first. If there is allocation from multiple leases, we attribute landings based on the order the leases were processed, on a first-in first-out basis.

Changes from Previous Years

Total recoverable costs can vary from year to year. Some management tasks may need to be done every year, and some tasks may require more time and effort in some years. As shown in Table 2, the tilefish IFQ recoverable costs in 2013 were higher than in previous years. Several different activities contributed to the overall increased staff time spent on the management of the tilefish fishery in 2013. The primary increase was from the Quality Assurance/Quality Control (QA/QC) of tilefish landings data to improve the accuracy and timeliness of dealer and Vessel Trip Report reported landings and price information. Although QA/QC of tilefish landings data was conducted prior to the IFQ system, individual quotas and the cost recovery process require greater attention to each landing report, particularly to dealer-reported price data. Some of the recoverable time for this task had not been accurately captured in previous years, and so was not included in prior bills. In addition, in 2013 we had a small rulemaking action to ensure the cost recovery regulations were consistent with the process as implemented, which added some time for SFD staff. OBD conducted additional work, including researching Treasury Department, Department of Commerce, and NOAA financial policies and guidance regarding fee collection and use of collected fees.

Table 2. Tilefish IFQ recoverable costs, value of the fishery, and fee percentage, 2010-2013.

Fee Year	2010	2011	2012	2013
Recoverable Costs	\$21,438	\$21,353	\$14,242	\$35,966
Total Fishery Value	\$5,054,073	\$5,566,543	\$5,372,291	\$5,787,335
Fee percentage	0.424%	0.3835%	0.2650%	0.6214%

Conclusion

We mailed bills for the 2013 tilefish IFQ fee to the 12 allocation shareholders on March 22, 2014. Allocation shareholders had 45 days to pay the balance due through the Northeast Region's Pay.gov section of the Fish-On-Line website. The majority of allocation shareholders paid their fee on time and there were no appeals of the initial fee calculations.
